

# *Jets and heavy flavours: an introduction*

Grégory Soyez

IPhT, CEA Saclay

Journées Jeunes Chercheurs 2010 — Nov 22-26 2010

- **generic introduction:** QCD and strong interactions  
What is QCD? Why do we need it (at the LHC)?
- **heavy flavour:**  
Why is it special, important, interesting?  
What are the main issues?
- **jets:**  
Why is it important? What are the main issues?

# ***Strong interactions***

# Quantum Chromodynamics: basics

QCD is the quantum theory for strong interactions

	QED	QCD
matter	$e, \mu, \tau$	6 quarks flavours $u, d, s, c, b, t$
vector	photon	gluon
quantum nr	charge	colour
sym. group	U(1)	SU(3)

Notes:

- quarks also carry elm charge/interact with photons
- SU(3): 3 fundamental colours (RGB) *i.e.* 3 for quarks, 8 for gluons
- SU(3) is non-abelian

# Quantum Chromodynamics: a non-abelian theory

2 main consequences:

- the gluons interact together

# Quantum Chromodynamics: a non-abelian theory

## 2 main consequences:

- the gluons interact together
- The “running” coupling constant ( $\alpha_s = g_s^2/(4\pi)$ ) decreases with energy

$$\alpha_s(p) = \frac{1}{b_0 \log(p^2/\Lambda_{\text{QCD}}^2)}$$

with

$$b_0 = \frac{11N_c - 2n_f}{12\pi}$$

$b_0 > 0$  for  $N_c = 3$  and  $n_f = 3 \dots 6$ .

# Quantum Chromodynamics: a non-abelian theory

## 2 main consequences:

- the gluons interact together
- The “running” coupling constant ( $\alpha_s = g_s^2/(4\pi)$ ) decreases with energy

# Quantum Chromodynamics: a non-abelian theory

## 2 main consequences:

- the gluons interact together
- The “running” coupling constant ( $\alpha_s = g_s^2/(4\pi)$ ) decreases with energy

## Note:

- $\alpha_s \sim 0.2 \gg \alpha_e$   
perturbative corrections larger
- Non-perturbative in the infrared ( $\lesssim 1$  GeV)

## Why is it important at the LHC?

Protons made of quarks and gluons

- ⇒ interact mostly through strong interactions
- ⇒ QCD needed for any single event even for electro-weak, Higgs or BSM!

# QCD at hadron colliders

Typical example: QCD needed for the PDF  
*i.e.* the quark and gluon contents of the proton

# The more realistic version

- Hard ME  
perturbative

# The more realistic version

- Hard ME  
perturbative
- Parton branching  
initial+final state radiation

# The more realistic version

- Hard ME  
perturbative
- Parton branching  
initial+final state radiation
- Hadronisation  
 $q, g \rightarrow$  hadrons

# The more realistic version

- Hard ME  
perturbative
- Parton branching  
initial+final state radiation
- Hadronisation  
 $q, g \rightarrow$  hadrons
- Multiple interactions  
Underlying event (UE)

# *Heavy quarks*

# Light and heavy quarks

## 6 quark flavours:

- $u, d, s$ : mass  $\approx 0$
- $c$ :  $m \sim 1.5$  GeV  
Etat typique:  $J/\Psi \equiv c\bar{c}$
- $b$ :  $m \sim 4.5$  GeV  
Etats typiques:  $B, \Upsilon$
- $t$ :  $m \sim 172$  GeV  
Decay into  $W$  and  $b$   
 $W \rightarrow q\bar{q}$  ( $\approx 66\%$ ),  $W \rightarrow \ell\nu$  ( $\approx 33\%$ )

# Why am I here?

- $m_{c,b,t} \gg \Lambda_{\text{QCD}}$ : we may apply perturbation theory
- $b$ :
  - could be tagged: displaced vertex
  - SM:  $b$  production vs. QCD, top decay
  - new physics search:
    - D0: like-sign  $\mu\mu$  charge asym (from  $b$  decay)
    - $H \rightarrow b\bar{b}$  dominant at low Higgs mass
- top:
  - top in the standard model *e.g.* mass measurement
  - BSM: coupling  $\propto m$ 
    - $\Rightarrow$  modifications in the top sector
    - $\Rightarrow$  very important at the LHC

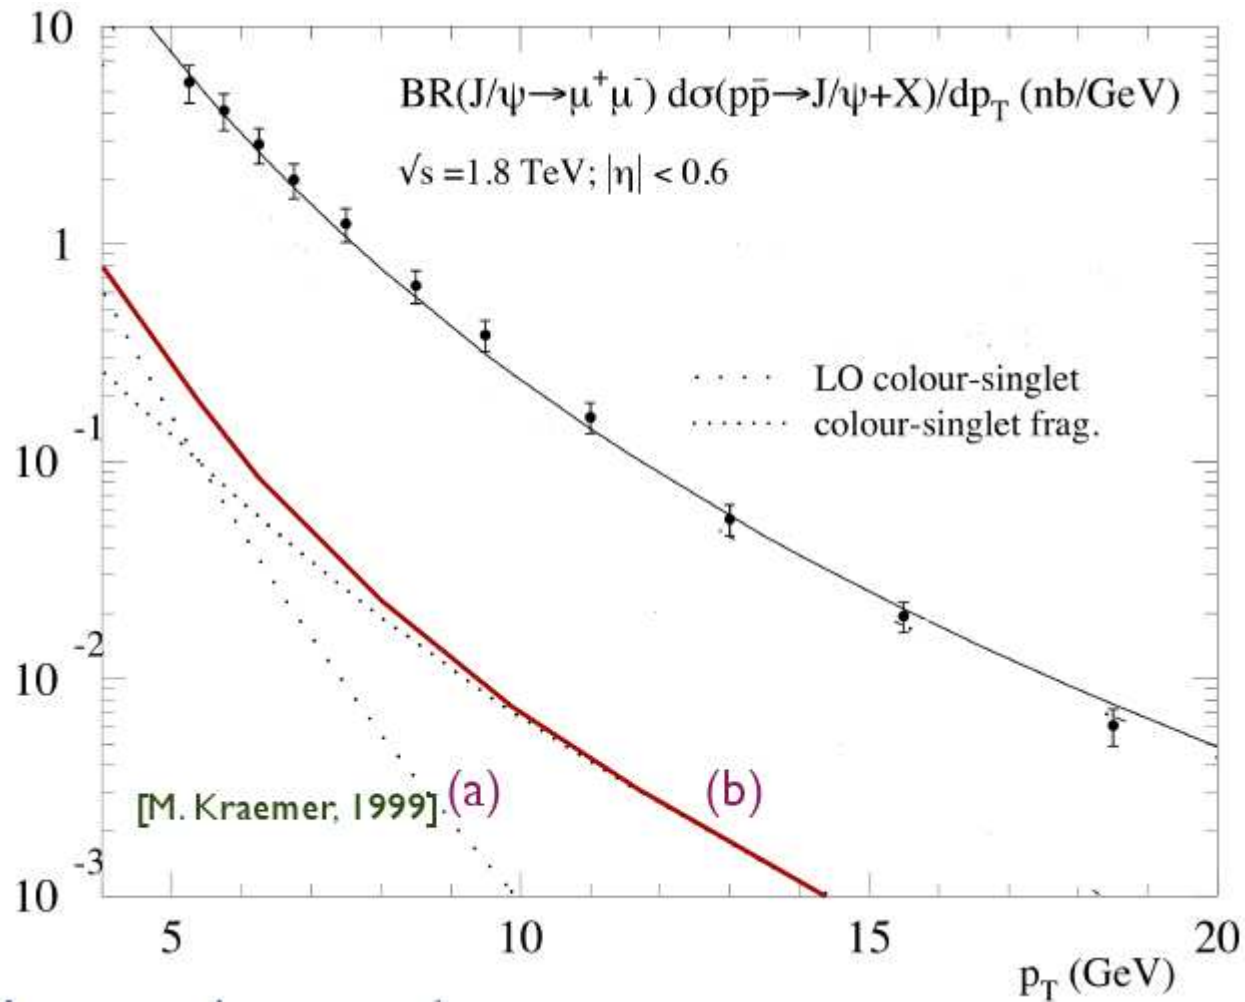

# Perturbative QCD: charm

$J/\Psi$  production:  $J\Psi$  from  $b$  decay

# Perturbative QCD: charm

$J/\Psi$  production: **Not the best agreement ever**

# Perturbative QCD: charm

$J/\Psi$  production: better with higher-order corrections\*

\* agreement not 100% understood

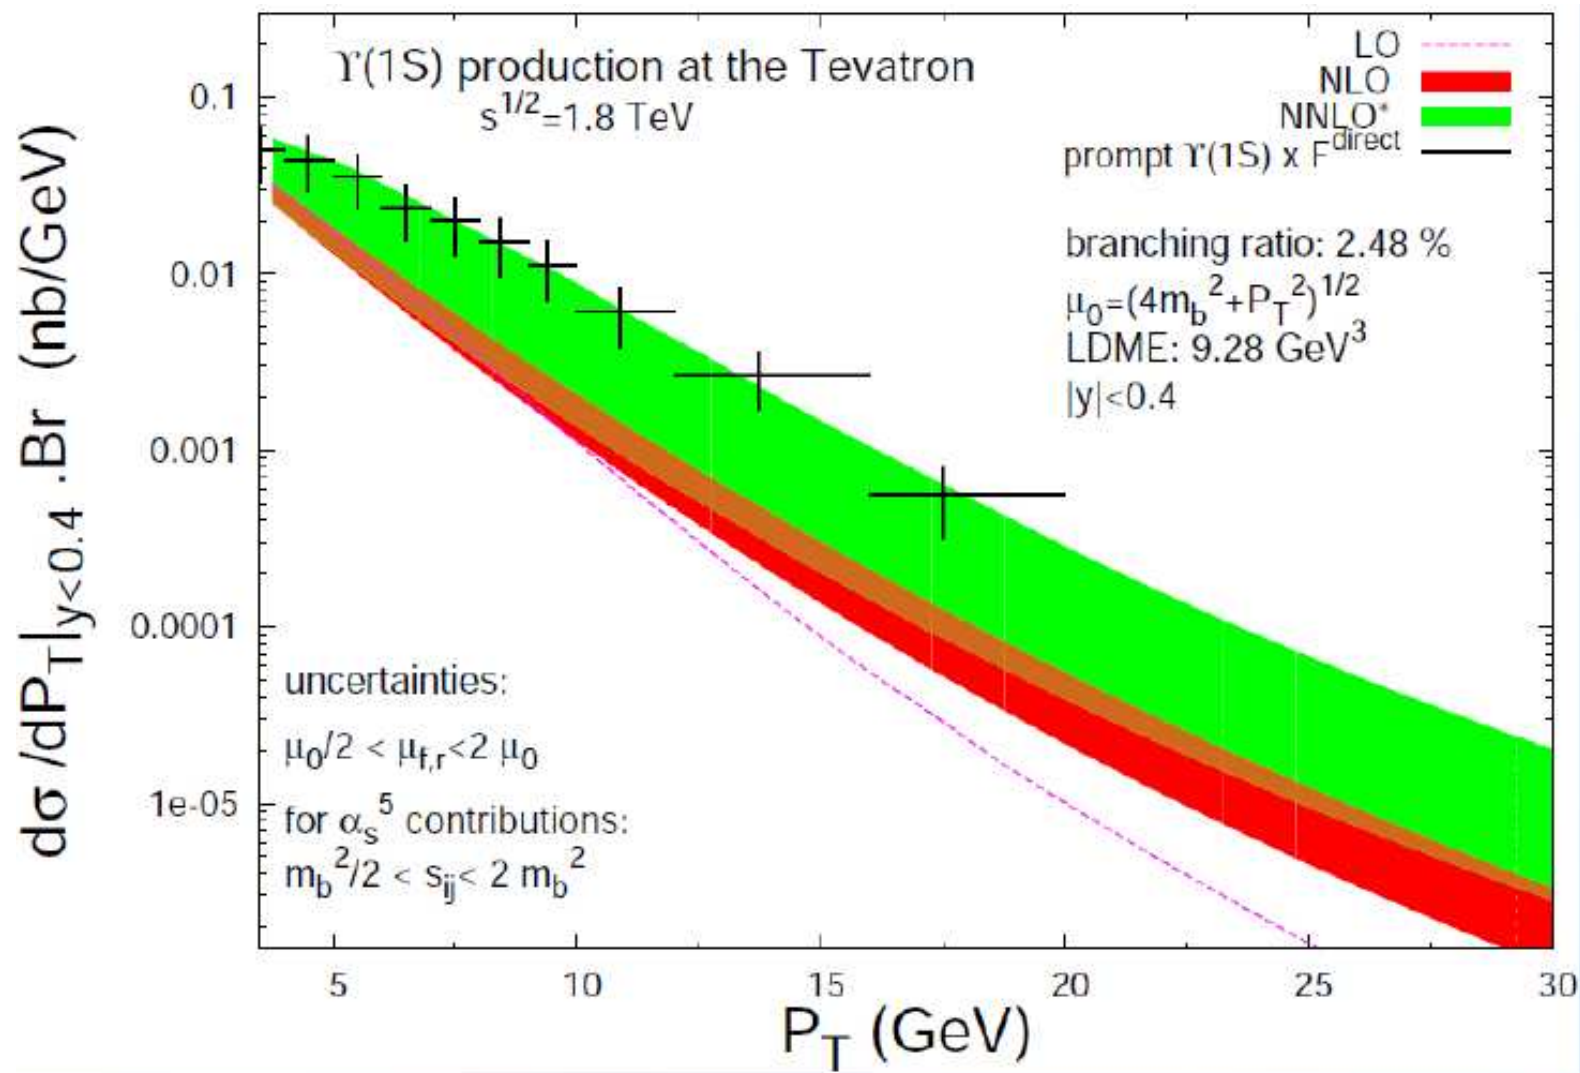

# Perturbative QCD: charm

$J/\Psi$  production: room for improvement

# Perturbative QCD: bottom

$J/\Psi$  production: again, higher-order important

## ● Production:

- Mostly  $gg \rightarrow t\bar{t}$
- Tevatron:  $\sigma_t \approx 10$  pb: **discovery!**
- LHC:  $\sigma_t \approx 1$  nb:  $\approx 10/s$  **LHC  $\equiv$  top factory**

## ● Decay:

- Mostly  $t \rightarrow Wb$   
 $t \rightarrow q\bar{q}b$  ( $\approx 66\%$ ) or  $t \rightarrow \ell\nu_\ell b$  ( $\approx 33\%$ )
- for  $t\bar{t}$ : 3 options
  - **leptonic**: not-so-easy because 2 neutrinos
  - **semi-leptonic**:  $\ell$ , 4 jets (2b) and  $\cancel{E}_t$   
(the most convenient)
  - **hadronic**: 6 jets *i.e.* technical to reconstruct  
but  $\approx 45\%$  of the stat!

## “discovery” at the Tevatron

FERMILAB-PUB-94/097-E

### Evidence for Top Quark Production in $\bar{p}p$ Collisions at $\sqrt{s} = 1.8$ TeV

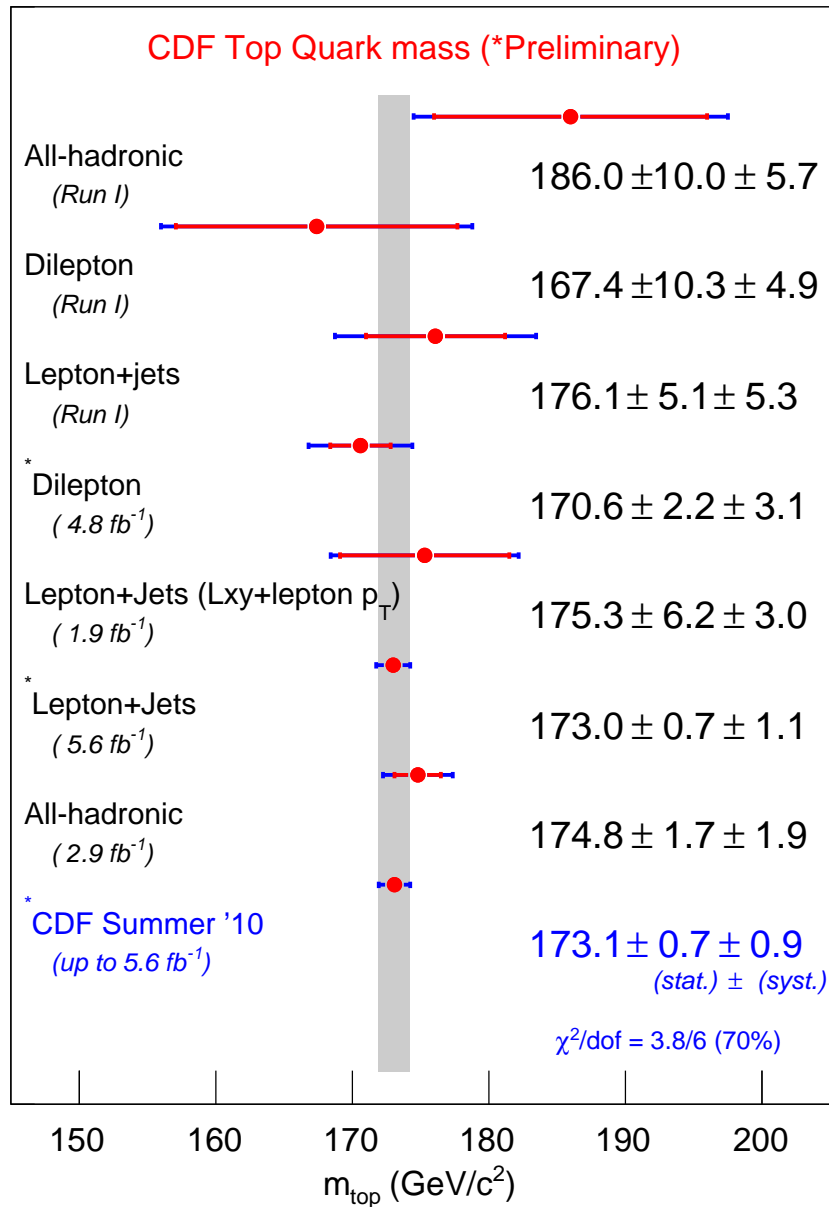

#### Abstract

We present the results of a search for the top quark in 19.3 pb<sup>-1</sup> of  $\bar{p}p$  collisions at  $\sqrt{s} = 1.8$  TeV. The data were collected at the Fermilab Tevatron collider using the Collider Detector at Fermilab (CDF). The search includes Standard Model  $t\bar{t}$  decays to final states  $e e \nu \bar{\nu}$ ,  $e \mu \nu \bar{\nu}$ , and  $\mu \mu \nu \bar{\nu}$  as well as  $e + \nu + \text{jets}$  or  $\mu + \nu + \text{jets}$ . In the  $(e, \mu) + \nu + \text{jets}$  channel we search for  $b$  quarks from  $t$  decays via secondary-vertex identification and via semileptonic decays of the  $b$  and cascade  $c$  quarks. In the dilepton final states we find two events with a background of  $0.56^{+0.25}_{-0.13}$  events. In the  $e, \mu + \nu + \text{jets}$  channel with a  $b$  identified via a secondary vertex, we find six events with a background of  $2.3 \pm 0.3$ . With a  $b$  identified via a semileptonic decay, we find seven events with a background of  $3.1 \pm 0.3$ . The secondary-vertex and semileptonic-decay samples have three events in common. The probability that the observed yield is consistent with the background is estimated to be 0.26%. The statistics are too limited to firmly establish the existence of the top quark, however a natural interpretation of the excess is that it is due to  $t\bar{t}$  production. We present several cross checks. Some support this hypothesis, others do not. Under the assumption that the excess yield over background is due to  $t\bar{t}$ , constrained fitting on a subset of the events yields a mass of  $174 \pm 10^{+13}_{-12}$  GeV/c<sup>2</sup> for the top quark. The  $t\bar{t}$  cross section, using this top quark mass to compute the acceptance, is measured to be  $13.9^{+6.1}_{-4.8}$  pb.

# Top mass today

## CDF today

## top very important at the LHC

- precision mass measurement
- many new physics scenario involve the top (mostly because of its large mass)

⇒ need to reconstruct as many tops as possible

## top very important at the LHC

- precision mass measurement
- many new physics scenario involve the top (mostly because of its large mass)

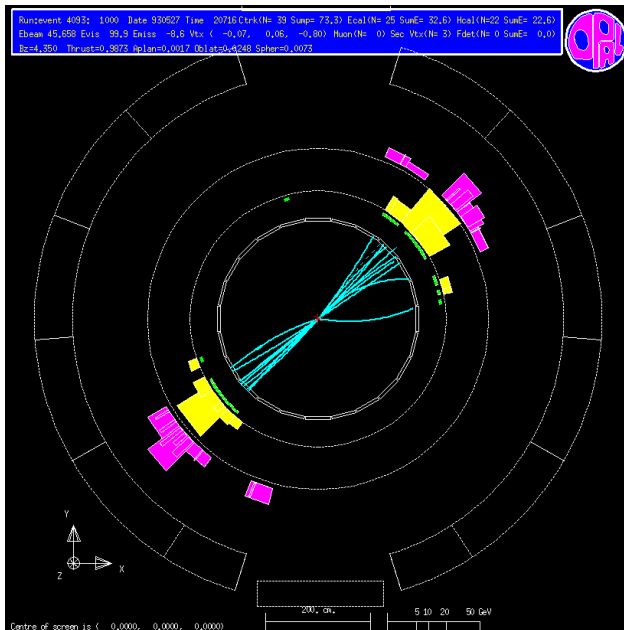

⇒ need to reconstruct as many tops as possible

### Issues:

- $W$ +jets background
- $b$  mis-tagging
- combinatorial background (especially for full hadr.)
- efforts e.g. in boosted-top reconstruction

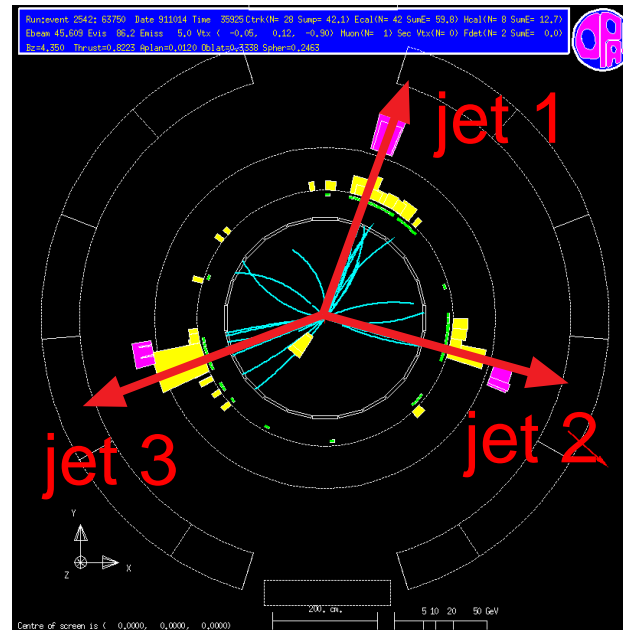

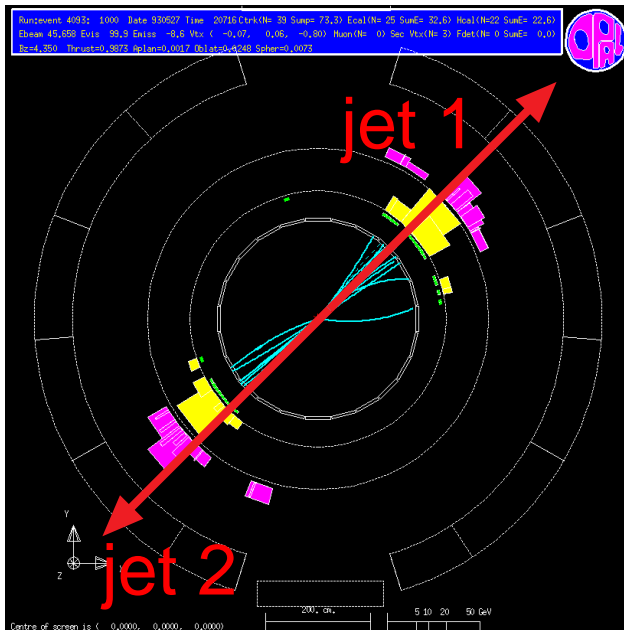

# ***Jets***

- Final-state events are pencil-like (already observed in  $e^+e^-$  collisions)

- Consequence of the collinear divergence  
 QCD branchings are most likely collinear  
 $(dP/d\theta \propto \alpha_s/\theta)$

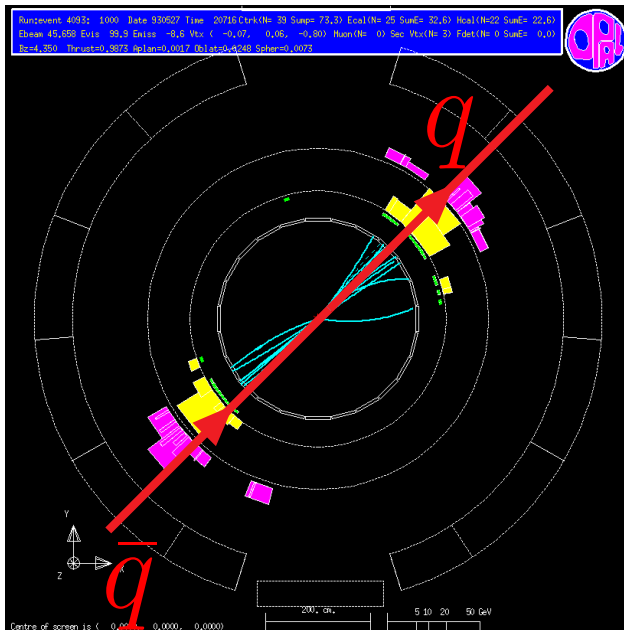

- Final-state events are pencil-like (already observed in  $e^+e^-$  collisions)

- Consequence of the collinear divergence  
QCD branchings are most likely collinear  
( $dP/d\theta \propto \alpha_s/\theta$ )

“Jets”  $\equiv$  bunch of collimated particles  $\cong$  hard partons

- Final-state events are pencil-like (already observed in  $e^+e^-$  collisions)

- Consequence of the collinear divergence  
QCD branchings are most likely collinear  
( $dP/d\theta \propto \alpha_s/\theta$ )

“Jets”  $\equiv$  bunch of collimated particles  $\cong$  hard partons

# Why worry

“Jets”  $\equiv$  bunch of collimated particles  $\cong$  hard partons

$\Rightarrow$  whenever you have QCD in the final state, you have jets in the final states!

*i.e.* jets useful mostly everywhere

# Jets and partons

“Jets”  $\equiv$  bunch of collimated particles  $\cong$  hard partons

obviously 2 jets

# Jets and partons

“Jets”  $\equiv$  bunch of collimated particles  $\cong$  hard partons

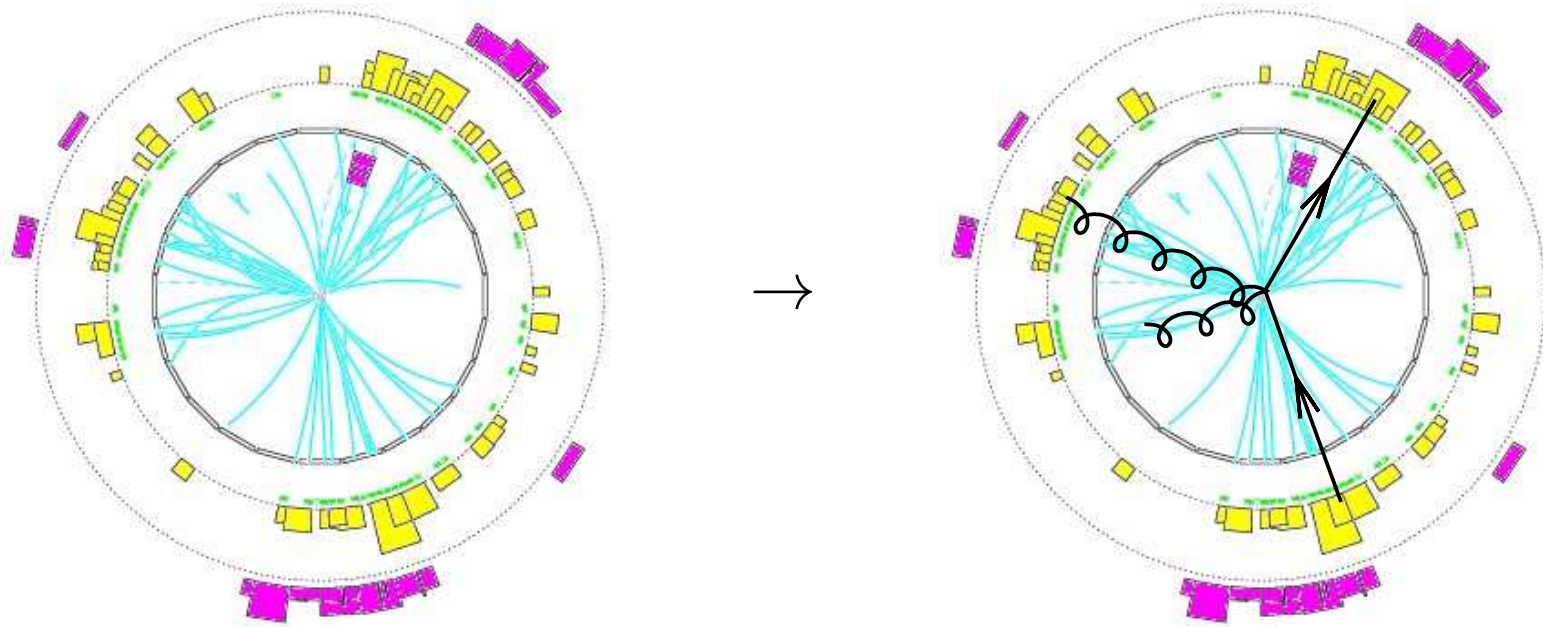

3 jets

# Jets and partons

“Jets”  $\equiv$  bunch of collimated particles  $\cong$  hard partons

3 jets... or 4?

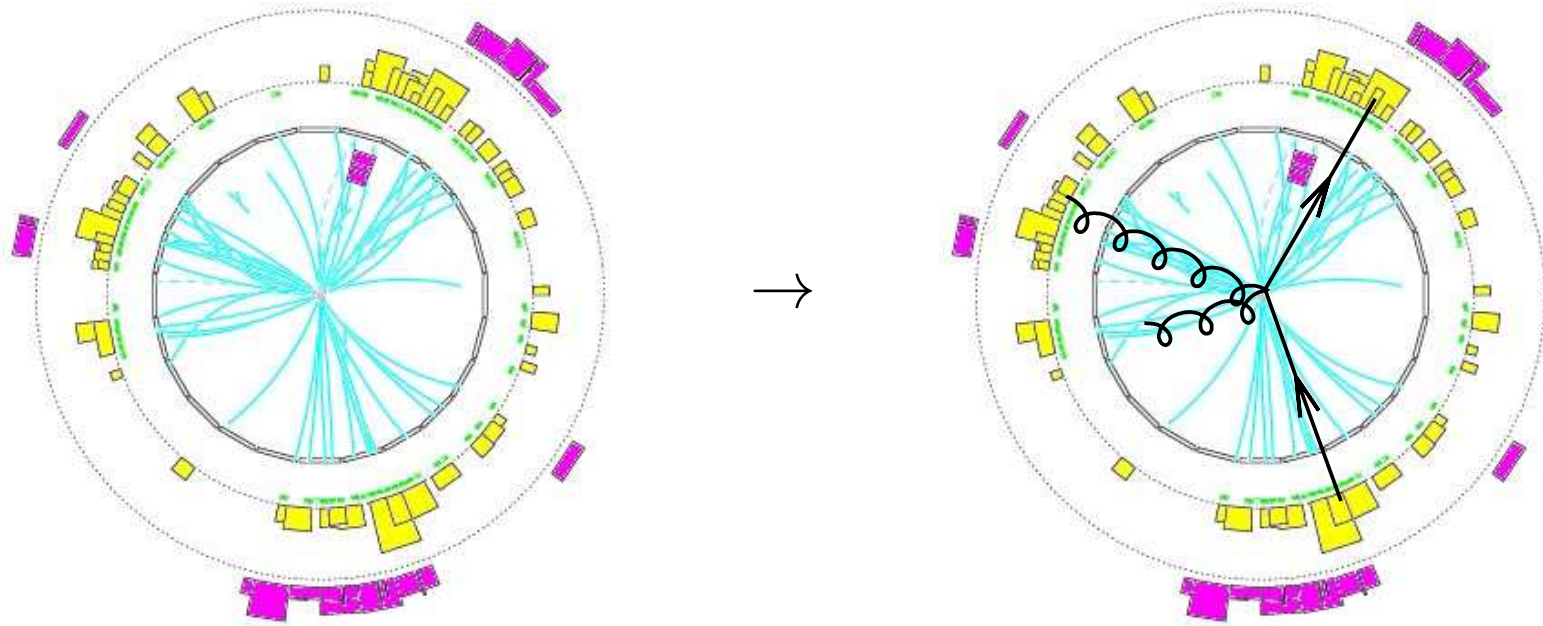

- “collinear” is arbitrary

# Jets and partons

“Jets”  $\equiv$  bunch of collimated particles  $\cong$  hard partons

3 jets... or 4?

- “collinear” is arbitrary
- “parton” concept strictly valid only at LO

A jet definition is supposed to be (as) consistent (as possible) across different view of an event

# *Jet definitions: constraints*

## SNOWMASS accords (FermiLab, 1990)

Several important properties that should be met by a jet definition are [3]:

1. Simple to implement in an experimental analysis;
2. Simple to implement in the theoretical calculation;
3. Defined at any order of perturbation theory;
4. Yields finite cross section at any order of perturbation theory;
5. Yields a cross section that is relatively insensitive to hadronization.

hire (many) PhD students  
to look at the (many) millions of events

Unless you have a better proposal?

# Jet definition: successive recombinations

Idea: Undo the QCD cascade

- Define an inter-particle distance  $d_{ij}$  and a beam distance  $d_{iB}$
- Successively
  - Find the minimum of all  $d_{ij}, d_{iB}$
  - If  $d_{ij}$ , recombine  $i + j \rightarrow k$  (remove  $i, j$ ; add  $k$ )
  - If  $d_{iB}$ , call  $i$  a jet (remove  $i$ )
- Until all particles have been clustered

# Jet definition: successive recombinations

Typical choice of distances:

$$d_{ij}^2 = \min(k_{t,i}^{2p}, k_{t,j}^{2p})(\Delta y_{ij}^2 + \Delta\phi_{ij}^2)$$

$$d_{iB}^2 = k_{t,i}^{2p} R^2$$

- $p = 1$ :  $k_t$  algorithm (1993)  
(as close as possible to pQCD)
- $p = 0$ : Cambridge-Aachen algorithm (1997)  
(close to pQCD; useful for substructure)
- $p = -1$ : anti- $k_t$  algorithm (2008)  
(circular/soft-resilient jets)

# Jet definition at the LHC

Both CMS  
and ATLAS  
use the anti- $k_t$

(ATLAS:  $R = 0.4$  and  $0.6$   
CMS:  $R = 0.5$  and  $0.7$ )

# *Jets are alive*

Still room for improvement:

- Experimentally:  
jet energy scale
- Theoretically/Experimentally:  
handle UE/pileup contamination
- Theoretically/Experimentally:  
Tag boosted objects
