$\text{I_1} \rightarrow \text{I_2} \backslash \text{gamma}$ in type III Seesaw

mercredi 5 mars 2008 17:55 (5 minutes)

The $\mu \rightarrow e \gamma$ and $\tau \rightarrow l \gamma$ decay rates are evaluated in the framework of the seesaw model with triplets of fermions. We show that the observation of one of these radiative decays by the new planned experiments would contradict the bounds which arise in this model coming from $\mu \rightarrow eee$ and $\tau \rightarrow l l l$ decays, which is an interesting possibility to exclude the model.
