Rare decays of the K_L and pi^0

mercredi 5 mars 2008 11:15 (15 minutes)

KTeV has new results on several rare and forbidden decays of the K_L and pi^0 . These include newly published searches for lepton flavor violation as well as measurements of all neutral pion decays with electrons in the final state. Some of these decay modes are being measured for the first time in decades, including the $pi^0 - e^+e^-$ decay which provides the only direct measurement of the pi^0 parity from a decay final state.
