Heavy Flavor Physics at the Tevatron (B_s)

mercredi 16 mars 2011 19:10 (15 minutes)

We report recent B-Physics results from the Tevatron, with special emphasis on B_s mesons. The topics covered include searches for rare flavor-changing neutral-current decays, searches for charm CP violation, CP violation in $B^0 \rightarrow J/\psi\phi$ and other B decays, and measurements of B decays and properties. The data used for the results described here are based on approximately 2.9– 6.9 fb⁻¹ of data collected by the CDF and DØ experiments at the Fermilab Tevatron, a proton-antiproton collider operating at a center-of-mass energy of 1.96 TeV.
