

First results from the CMD-3 detector at the VEPP-2000 e^+e^- collider

samedi 23 juillet 2011 09:15 (15 minutes)

The CMD-3 detector at the VEPP-2000 electron-positron collider in the Budker Institute in Novosibirsk collected about 20/pb in the center-of-mass energy range from 1 to 2 GeV during the first year of operation. First results on the hadronic cross sections are reported important for improving the precision of the theoretical predictions for the muon anomalous magnetic moment.
