

Open charm hadron production and spectroscopy at LHCb

Friday, July 22, 2011 9:15 AM (15 minutes)

Measurements for open charm hadron production and spectroscopy at LHCb, and future prospects are presented. The LHCb detector is designed for the observation of heavy flavour decays with a fully instrumented forward coverage that is unique among the LHC experiments. These features, with the prolific charm production in $\sqrt{s}=7$ TeV proton-proton collisions, make LHCb ideally suited to perform precise measurements of charm production and spectroscopy that test QCD in this new energy regime.
