

ALICE results for Pb-Pb collisions

Thursday, July 21, 2011 10:00 AM (30 minutes)

ALICE (A Large Ion Collider Experiment) is the LHC experiment specifically designed to study QCD matter under extreme conditions of temperature and pressure. The aim is to study the Quark-Gluon Plasma obtained with high energy nucleus-nucleus collisions and to characterize its properties. Results from the ALICE experiment for $\sqrt{s_{NN}}=2.76$ TeV Pb-Pb collisions will be presented and compared with predictions and lower energy heavy-ion collisions.
