Stop pair production: final state

$M_{stop}=160 \text{ GeV}$: 1111 stop pairs in 5 fb^{-1}

Stop production

- *Madgraph files have been produced
Thanks to Dennis Mackin for
providing SDECAY files.*
- *Caf trees have been produced
Thanks to Alan Wilson*

- $\Delta\Phi(\text{muon, Met}) > 0.5$
- $\Delta\Phi(\text{tau, Met}) > 0.5$

Instrumental background estimation

- Shape given by OS events with $0.3 < \mathcal{N}N_{\tau} < 0.85$

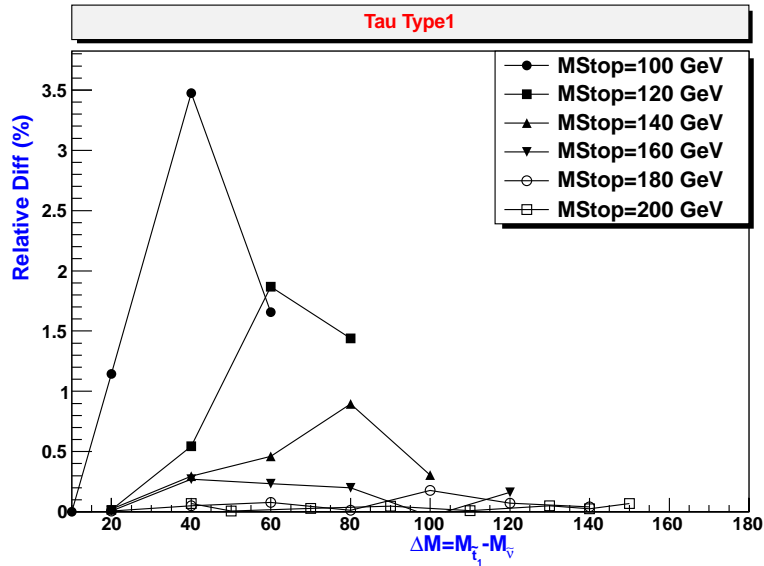

- Norm.: in a control region: same as the signal except $\Delta\Phi(\tau, Met) < 0.5$

τ Type	Norm factor RunIIa+RunIIb
1	0.28 ± 0.03
2	0.35 ± 0.03
3	0.11 ± 0.01

Instrumental background estimation - impact of stop

- Re-estimate the normalization factors with stop signals

The effect does not exceed 5%.
-> Systematic uncertainty
(on the shape: ~10%)

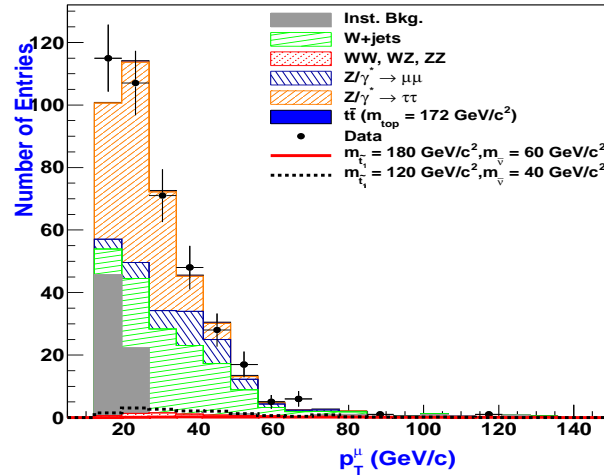

$\mu\tau$ analysis strategy

- *Selection:*
 - *preselection: one muon, one central tau*
 - *at least one jet*
 - *Three sub-samples depending on the number of jets:*
 - *njets=1*
 - *njets=2*
 - *njets>=3*
 - *BDTs are estimated for each sub-sample*
- (MC samples were divided in two parts: 2/3 for the BDT computations, 1/3 for the analysis).*
- *BDT outputs are used to estimate the limits with Collie*
 - *N.B: a tau-jet fake rate has been performed and results included. Will not be shown here (see the DØ note).*
