Reconstructing large protein assemblies Modeling with uncertainties: Toleranced Models Assessing the reconstruction of assemblies Mining contacts: contact probabilities Mining complexes: stoichiometry, volume ratio Mining complexes: graphical models Conclusion Software of potential interest

▲ロト ▲帰 ト ▲ヨト ▲ヨト - ヨ - の々ぐ

Structural Dynamics of Macromolecular Processes Reconstructing Large Macro-molecular Assemblies

- Molecular motors
- NPC
- Actin filaments
- Chaperonins
- Virions
- ATP synthase

Core questions

Difficulties

Modularity Flexibility Reconstruction / animation Integration of (various) experimental data Coherence model vs experimental data

▷Ref: Russel et al, Current Opinion in Cell Biology, 2009

Reconstructing Large Assemblies:

a NMR-like Data Integration Process

▷ Four ingredients

- Experimental data
- Model: collection of balls
- Scoring function: sum of restraints restraint : function measuring the agreement ≪model vs exp. data≫
- Optimization method (simulated annealing,...)

▲ロト ▲帰 ト ▲ヨト ▲ヨト - ヨ - の々ぐ

▷ Restraints, experimental data and ... ambiguities:

Assembly	: shape	cryo-EM	fuzzy envelopes
Assembly	: symmetry	cryo-EM	idem
Complexes:	: interactions	TAP (Y2H, overlay assays)	stoichiometry
Instance:	: shape	Ultra-centrifugation	rough shape (ellipsoids)
Instances:	: locations	Immuno-EM	positional uncertainties

▷Ref: Alber et al, Ann. Rev. Biochem. 2008 + Structure 2005

The Nuclear Pore Complex: Structure and Reconstruction

- Eight-fold axial + planar symmetry

- 456 protein instances of 30 protein types $(456 = 8 \times (28 + 29))$

Reconstruction results: N = 1000 optimized structures (balls):
(i) blending the balls of all the instances of one type over the N structures:

one 3D probability density map per protein type

(ii) superimposing these maps provides a global fuzzy model

Qualitative results:

Our map is sufficient to determine the relative positions within NPC ...limited precision; not to be mistaken with the density map from EM The localization volumes ... allow a visual interpretation of proximities

▷Ref: Alber et al; Nature; 450; 2007

NPC: Example Density Maps Stoichiometry vs number of connected components

Cases: equal (Nup157); larger (Sec13)

Cases: smaller (Nup170, Pom152)

 \bigcirc

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

▶ Two types of problems:

number of connected components vs stoichiometry volume of each connected component vs. volume estimated from the sequence

>Ref: Alber et al; Nature; 450; 2007

Uncertainties of the Density Maps

Volume of connected components of non empty voxels vs. reference volume (estimated from the sequence)

Putative Models of Sub-complexes: the Y-complex

The Y-complex: pairwise contacts

▷Ref: Blobel et al; Nature SMB; 2009

> Y-based head-to-tail ring vs. upward-downward pointing

▷Ref: Seo et al; PNAS; 2009

▷Ref: Brohawn, Schwarz; Nature MSB; 2009

 $\Rightarrow Bridging the gap between both classes of models?$

The Zoo of curved Voronoi diagrams

▷ Power diagram: $d(S(c,r),p) = ||c-p||^2 - r^2$

▷ Apollonius diagram: d(S(c, r), p) = ||c - p|| - r ▷ Mobius diagram: $d(S(c, \mu, \alpha), p) = \mu ||c - p||^2 - \alpha^2$

▷ Compoundly Weighted Voronoi diagram: $d(S(c, \mu, \alpha), p) = \mu ||c - p|| - \alpha$

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Building toleranced models (Embracing the geometric noise.)

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Uncertain Data and Toleranced Models: the Example of Molecular Probability Density Maps

Probability Density Map of a Flexible Complex:

 Each point of the probability density map: probability of being covered by a conformation

Question:

accommodating high/low density regions?

▷ Toleranced ball $\overline{S_i}$

- Two concentric balls of radius $r_i^- < r_i^+$: inner ball $\overline{S_i}[r_i^-]$: high confidence region outer ball $\overline{S_i}[r_i^+]$: low confidence region
- ▷ Space-filling diagram \mathcal{F}_{λ} : a continuum of models - Radius interpolation: $r_i(\lambda) = r_i^- + \lambda(r_i^+ - r_i^-)$

Multiplicative weights required Ref: Cazals, Dreyfus; Symp. Geom. Processing; 2010

Toleranced Models for the NPC

- ▷ Input: 30 probability density maps from Sali et al.
- Output: 456 toleranced proteins
- ▷ Rationale:
 - \rightarrow assign protein instances to pronounced local maxima of the maps
- Geometry of instances:
 - four canonical shapes
 - controlling $r_i^+ r_i^-$: w.r.t volume estimated from the sequence

(i) Canonical shapes (

(ii) NPC at
$$\lambda = 0$$
 (iii) NPC at $\lambda = 1$

- Freq. split into 3 classes, a = 0.25, b = 0.65: $F_1 : f_{ij} \le a; F_2 : a < f_{ij} < b; F_3 : b \le f_{ij}$

 Limitations: contact can be shallow stoichiometry missing

Contact Probabilities versus Contact Probabilities

▷ Over-represented in Sali et al: $Nup84 - Nup60 : f_{ij} = 0.07$

▷ Under-represented in Sali et al: $Nup192 - Pom152 : f_{ij} = 0.98$

- \triangleright Contacts for two types p_i and p_j
- Consider: the Hasse diagram for $\lambda \in [0, \lambda_{max}]$ a stoichiometry $k \ge 1$
- Define: $\lambda(p_i, p_j)$: smallest λ \exists k contacts between p_i and p_j
- Contact proba.: $p_{ij}^{(k)} = 1 \lambda(p_i, p_j)/\lambda_{max}$ - Contact curve: $p_{ij}^{(k)} = f(k)$

Note: λ_{max} tuned to match the uncertainties on the input

Contact Curves: Insights on (models of) the Y-complex

Assessment w.r.t. a Set of Protein Types: Geometry, Topology, Biochemistry

▶ Input:

- Toleranced model

-T: set of proteins types, the red proteins (TAP, types involved in sub-complex)

Output, overall assembly:

- Geometry - biochemistry:

number of isolated copies - symmetry analysis

TAP data: complex or mixture?

- Topological stability: death date - birth date (cf α -shape demo)

Output, per complex:

- Biochemistry: stoichiometry of protein instances per copy

- Geometry, volume ratio: volume occupied vs. expected volume

Assessing a toleranced model w.r.t a high-resolution structural model

Assembly Complex: skeleton graph Template: skeleton graph

(日) (同) (日) (日)

Assessment w.r.t. a High-resolution Structural Model: Contact Analysis

Input: two skeleton graphs

- template G_t , the red proteins : contacts within an atomic resolution model
- complex G_C : skeleton graph of a complex of a node of the Hasse diagram

▷ Output: graph comparison, complex G_C versus template G_t: (common/missing/extra) × (proteins/contacts)
