Introduction		
A bit of History		

• Fermion

- Weak Interactions : exchange of Boson W, Z
- \Rightarrow escapes dense regions
 - Elementary particle : no compositeness, no decay
 - Mass close to zero
- \Rightarrow velocity *c*
 - Neutral particle
- \Rightarrow no effect of magnetic fields

・ロト ・四ト ・ヨト ・ヨト

Introduction		
A bit of History		

A brief history of neutrinos...

 1930 : Pauli invents the neutrino to explain β decay...I have done something very bad today by proposing a particle that cannot be detected ; it is something no theorist should ever do.

- 1933 : Fermi develops the theory of the little neutron (neutrino), discovered in 1932 by Chadwick
- 1953 : Experimental observation at Savannah River (Reines & Cowan) through $\bar\nu+p\to e^++n$

・ロト ・四ト ・ヨト ・ヨト

Introduction		
A bit of History		

A brief history of neutrinos...

• 1968 : Solar Neutrinos observed at Homestake (Davis) - only the third of expectations...(see A. Meregaglia's lecture yesterday)

1987 : SN1987A in Large Magellanic Could

Neutrinos and Cosmic-Rays		
	lactic Sources	

Upper Bounds

Bounds for extra-galactic sources

- Waxman-Bahcall upper bound :
 - $E^2 \frac{dN}{dE} \approx 10^{44} erg/Mpc^3/yr$ from observed CR fluxes
 - Assume optically thin sources and evolution with z
- Mannheim, Protheroe, Rachen (MPR) Bound :
 - Different injection spectra, optically thin/hidden sources

ト・モー

Neutrinos and Cosmic-Rays		

Upper Bounds

Bounds for extra-galactic sources

- Optical depth $\frac{1}{I_0} = e^{-\tau}$, measures how opaque is a medium to a radiation
- $dl = -\kappa \rho I dl$, with κ opacity in cm^2/g , ρ density of medium
- Finally $\mathcal{L} = \frac{1}{\kappa\rho}$ and $\tau = \int \kappa\rho dl = \int n\sigma dl$, with *n* number density, σ cross-section
- \Rightarrow τ = number of mean free paths through medium
 - Optically thin $\tau \ll 1$
 - 1 km of Earth atmosphere : $\kappa \sim 10^{-4} {\it cm}^2/{\it g}, \, \rho \sim 10^{-3} {\it g}/{\it cm}^3,$ $\tau \sim 10^{-2}$
 - \Rightarrow Double the material, double the exctinction
 - Optically thick $\tau \gg 1$
 - 1 km of polluted city atmosphere : $\kappa\sim 0.1 cm^2/g,\,\rho\sim 10^{-3}g/cm^3,\,\tau\sim 10$
 - $\Rightarrow\,$ No radiation, except outer layers and blackbody

Neutrinos and Cosmic-Rays		
	Extra-Gal	

Upper Bounds

Bounds for extra-galactic sources

- Controversial but $E_{
 u}^2 \Phi_{
 u} \lesssim 10^{-8} GeV.cm^{-2}.s^{-1}.sr^{-1}$
- $\Phi_{\gamma}^{\text{Crab}}(E > 1 \text{TeV}) \approx 10^{-11} \text{cm}^{-2}.\text{s}^{-1}...$
- With a ν cross-section $\in 10^{-35} 10^{-33} cm^2$ for $E \sim 1 TeV 1 PeV$...

 \Rightarrow Needs large detection volumes!

	Neutrin	o Telescopes	

Energy Losses

Energy Losses and muon range

- Muon Range $R_{\mu} = \int_{0}^{E} \frac{dx}{dE} dE \approx \int_{0}^{E} \frac{dE}{a+bE} = \frac{1}{b} \log \left(1 + \frac{E}{E_{c}}\right)$ with $E_{c} = a/b$ critical energy
- For upgoing muons, the interaction volume is much larger than instrumented volume !

	Neutrino	o Telescopes	
		Muon Detection	

Cherenkov Effect

Charged Particle with velocity > phase velocity of light

- $v > \frac{c}{n}$ or $\beta > \frac{1}{n}$ refraction index
- Coherent emission along a cone of $heta_{\it C}\sim{
 m constant}$
- $heta_{C} \sim 1^{\circ}$ in air, $heta_{C} \sim 43^{\circ}$ in water, $heta_{C} \sim 41^{\circ}$ in ice

Th. Pradier (University of Strasbourg)

		Muon Detection	

Cherenkov Effect

Number of Photons

$$\frac{d^2N}{dxd\lambda} = \frac{2\pi\alpha}{\lambda^2} \left(1 - \frac{1}{n^2\beta^2}\right) \approx \frac{2\pi\alpha}{\lambda^2} \sin\theta_C^2$$

- Between 300-600 nm, $\frac{dN}{dx} \approx$ 350 photons/cm
- $\frac{d^2N}{dEdx} \approx 370 \sin^2 \theta_C(E) eV^{-1} cm^{-1} \approx 10^{-4} \times 2MeV/cm$
- But directional effect !

	Neutrino	Telescopes	
			Radiation Media

Different radiators...

Photons are absorbed and scattered

$$I(r) \propto rac{1}{R} e^{-R/\lambda_{
m att}}$$

• Note the 1/R because light on a cone, not on a sphere! (not so easy to demonstrate!)

• Here Attenuation length :
$$\frac{1}{\lambda_{\mathrm{att}}} = \frac{1}{\lambda_{\mathrm{abs}}} + \frac{1}{\lambda_{\mathrm{scatt}}}$$

Medium	Attenuation	Absorption	Scattering	$\Delta \theta$ 10 TeV
Sea water	40-50m	50-60m	>200m	0.2°
Lake Baikal	20m	15-30m	>100m	1.5°
Polar Ice		100m	25m	3°

- \bullet lce : no current, no bioluminescence, no β decay from salt
- Water : less scattering, better angular resolution
