ATLAS

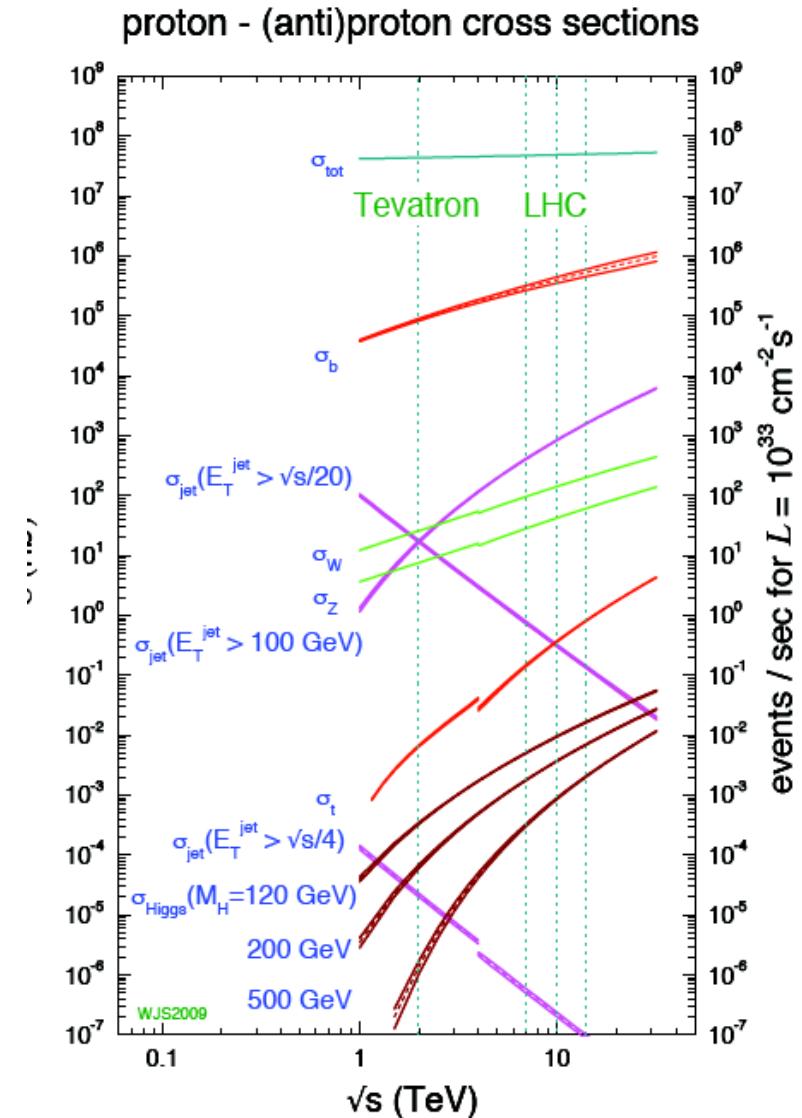

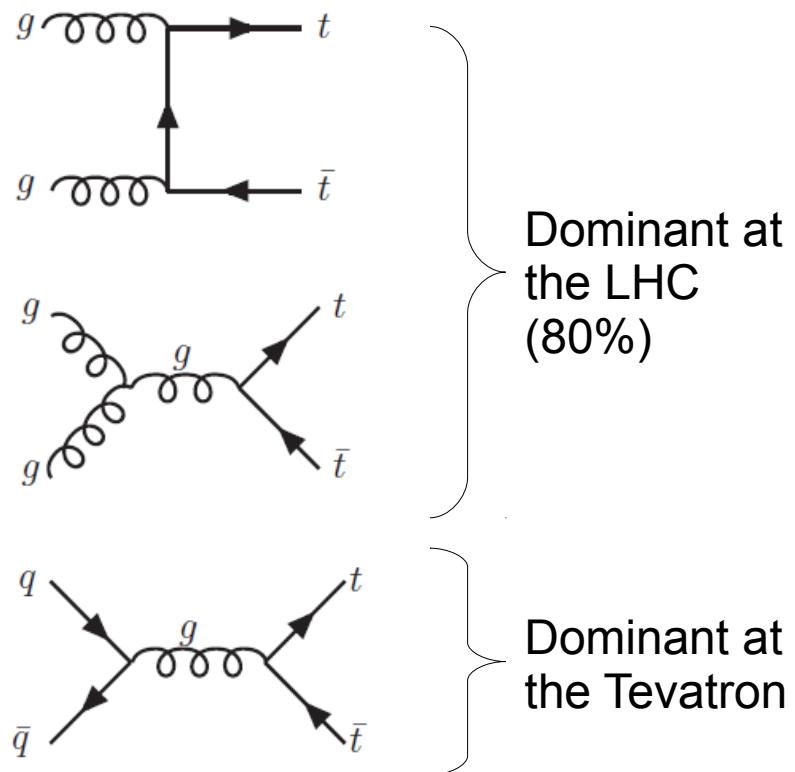

New heavy quarks

- Over the past decades, Standard Model (SM) has been very successful in describing all the experimental measurements using “only” three generations of quarks and lepton family
- Many BSM models predict new heavy quarks: Extra-dimension, little higgs, new SM like generations, GUTs, etc...
- → Can be vector like, can have flavor changing neutral current decays, etc...
- Initial searches at the LHC focus mainly on pair produced heavy quarks, decaying mostly like the top-quark
- Benchmark model:
 - Simplest extension of the SM: 4th sequential generation of fermions

		Quarks			
		u	c	t	t'
		d	s	b	b'
		v _e	v _μ	v _τ	v'
		e	μ	τ	τ'
		I	II	III	IV

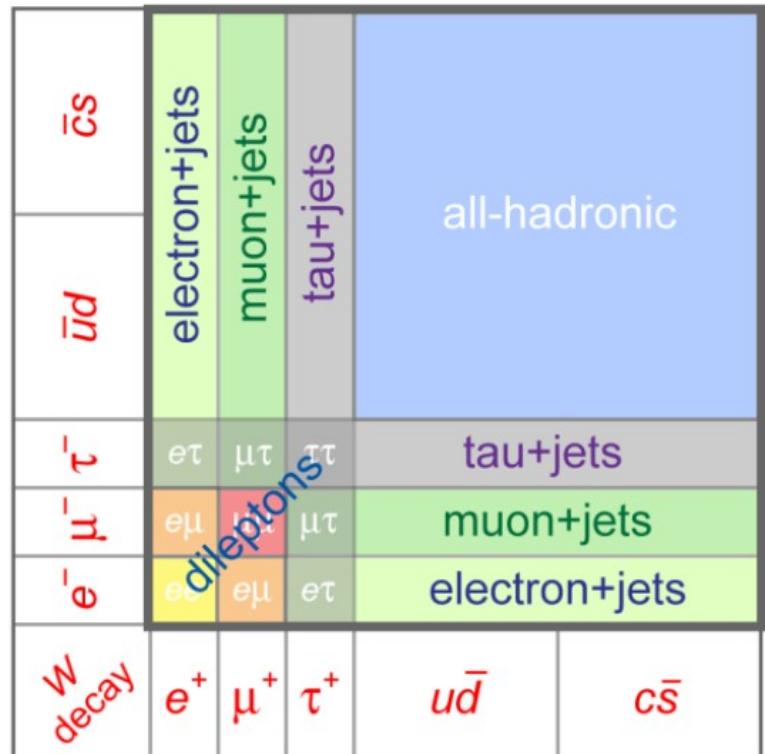

Top Quark Pair Production

- σ_{tt} (7 TeV LHC) $\sim 165 \text{ pb}$ (172.5 GeV, Moch, Uwer, Langenfeld (Phys. Rev. D78 (2008) 034003, arXiv:0907.2527) = 20 σ_{tt} (Tevatron)
- 4fb⁻¹ @ 7 TeV already on tape
→ 660K ttbar pairs (~8 times Tevatron statistics)

Top Quark Event Topology

- Almost all top quarks decay to $t \rightarrow W b$
- Final states classified by W decay modes
 $W \rightarrow q\bar{q}$ (2/3) or $W \rightarrow l\nu$ (1/3)
 - All hadronic (no $W \rightarrow l\nu$) $\rightarrow 4/9$ ($\sim 45\%$)
 - Semi-leptonic (1 $W \rightarrow l\nu$) $\rightarrow 4/9$ (only electron/muon considered $\rightarrow \sim 31\%$)
 - Di-leptonic (2 $W \rightarrow l\nu$) $\rightarrow 1/9$ (only electron /muon considered $\rightarrow \sim 5\%$)

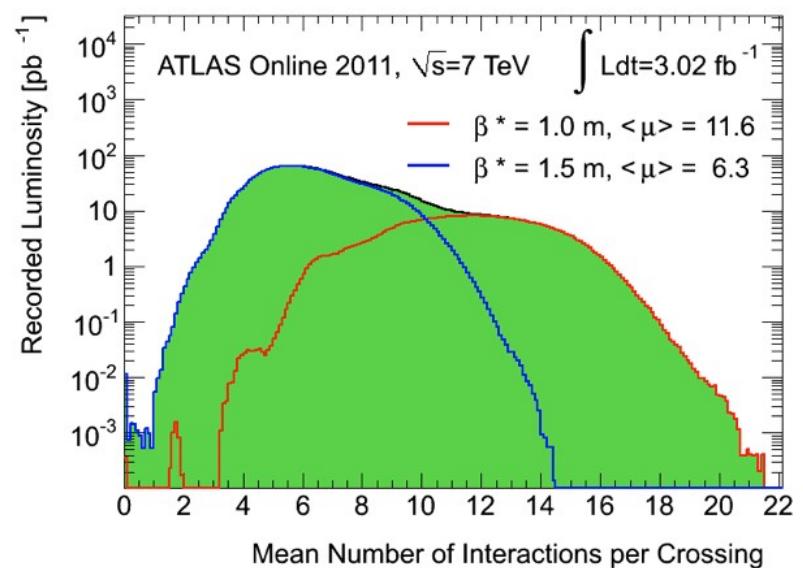

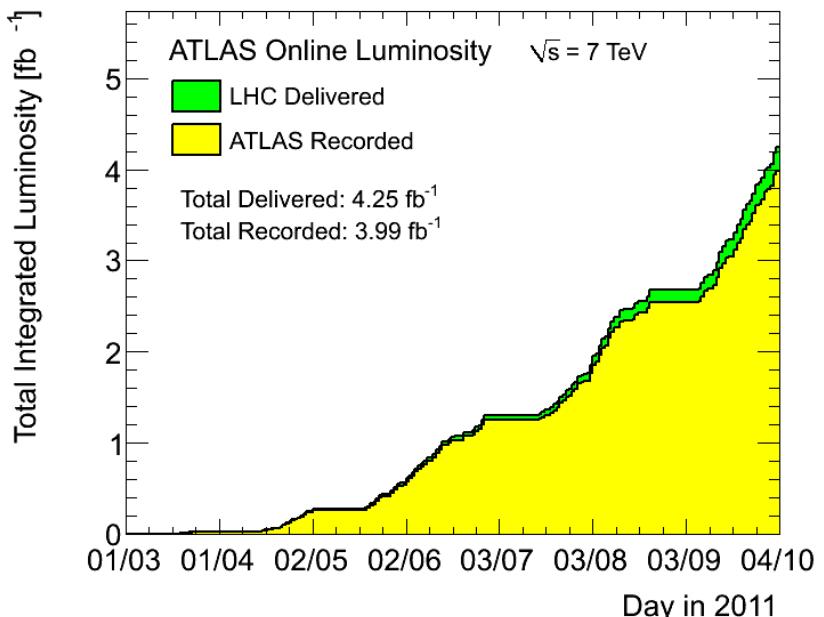

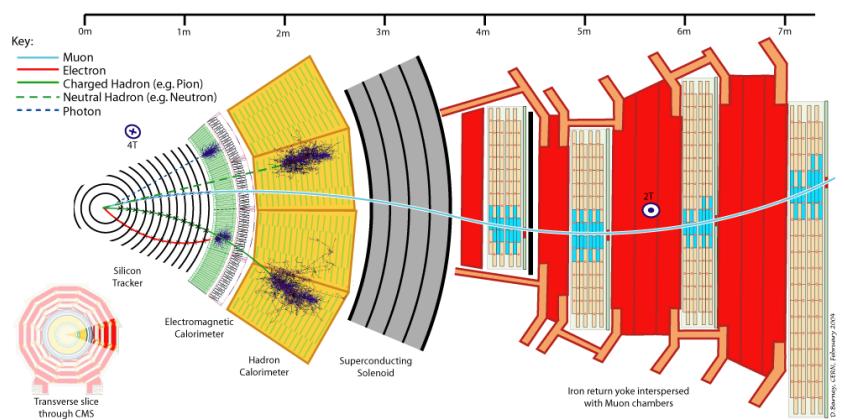

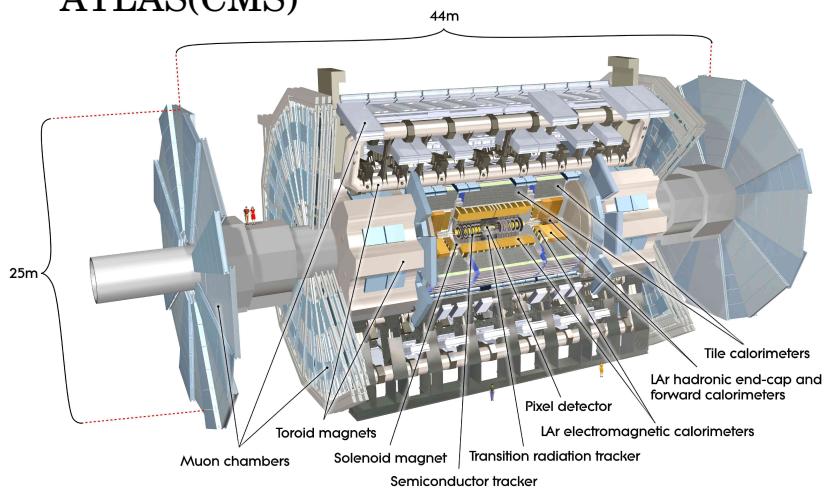

- The top-quark provides a virtual lab to search for new physics
 - Many tops have already been produced at LHC!!
 - Various properties of the top-quark have been measured
 - This helps us to provide procedures/tools to separate SM backgrounds from new physics

Search for heavy quarks

- As with top-quark production, the heavy quark pair production is larger than the single production (exception for VLQ, quarks with anomalous couplings, large mixing with other generations)
- Commonly heavy quarks search channels for 4th generation $\rightarrow t'$, b'
 - Up type quark t' : $t't' \rightarrow WbWb$ (EW precision data favors $m_{t'}-m_{b'} < m_W$)
 - Down type quark b' : $b'b' \rightarrow tWtW \rightarrow WbW WbW$
- Also searches for objects that decays into top pairs + X
 - $T \rightarrow t + DM$
 - $T \rightarrow tH, tZ$ (no presented here)

Detectors and LHC Data

- Data collected in 2011 → up to 4 fb^{-1}
- Maximum instantaneous luminosity $3.3 \times 10^{-33} \text{ cm}^{-2} \text{s}^{-1}$
- Pileup up to $\langle \text{nvtx} \rangle = 16$ (depending on the LHC)
- Luminosity uncertainty down to 3.4(4.5)% in ATLAS(CMS)

Monte-Carlos

- Signal generated with Pythia or MadGraph (ATLAS/CMS)
- Signal cross-sections from HATHOR (NNLO approximation)
- Backgrounds:
 - ATLAS: MC@NLO for ttbar, single top, Alpgen for W/Z+jets, Herwig for dibosons
 - CMS: Pythia, MadGraph
 - For fake leptons: Obtained via data-driven techniques → loosening the lepton ID criteria and extracting tight vs loose efficiencies in control samples

Results Covered In This Talk

- **ATLAS results** → <https://twiki.cern.ch/twiki/bin/view/AtlasPublic/TopPublicResults>
 - Search for Up-Type Fourth Generation Quarks in the Diepton plus Jets Channel (37pb-1, ATLAS-CONF-2011-022)
 - Inclusive search for same-sign dilepton signatures in pp collisions at $\sqrt{s} = 7$ TeV with the ATLAS detector (35pb-1, arXiv:1108.0366)
 - Search for New Phenomena in ttbar Events With Large Missing Transverse Momentum (1.04fb-1, arXiv:1109.4725)
 - **Search for Up-Type Fourth Generation Quarks in the Lepton plus Jets Channel (1.04fb-1)** (not yet public, under approval process, not showing details)
- **CMS results** → <https://twiki.cern.ch/twiki/bin/view/CMSPublic/PhysicsResults>
 - Search for a Heavy Bottom-like Quark (1.14fb-1, CMS PAS EXO-11-036)
 - Search for a Heavy Top-like Quark in the Dilepton Final state (1.14fb-1, PAS-EXO-11-050)
 - Search for pair production of a fourth-generation t' quark in the lepton-plus-jets channel (0.82-0.57 fb-1, PAS-EXO-11-051)
 - Inclusive search for a fourth generation of quarks (1.1 fb-1, PAS-EXO-11-054)

CMS – Search for b' 1/3

PAS-EXO-11-036

- $b'b' \rightarrow tWtW \rightarrow WbW WbW$
 - 2 same sign or three isolated leptons (e/mu) in the final state $\rightarrow 7.3\%$ of the decay
 - Dilepton triggers $\rightarrow 92\%$ (mu/mu), 96% (e/mu), $>99\%$ (e/e)
- Selection criteria:
 - Muons: $pT > 20\text{GeV}$, $| \eta | < 2.4$; isolation $\sum ET(\Delta R < 0.3) - \text{pileup} < 0.15 * pT$
 - Electron: $pT > 20\text{GeV}$, $| \eta | < 2.4 \notin 1.44 < | \eta | < 1.57$; isolation $\sum ET(\Delta R < 0.3) - \text{pileup} < 0.06 * pT$
 - Select event with 2 opposite sign leptons or three leptons (2 of them opposite charge)
 - For same flavor leptons $\rightarrow Z$ mass veto: $| m_{ll} - m_Z | > 10\text{GeV}$
 - B-tagging based on IP significance $\rightarrow 50\%$ b-tag efficiency; 1% mistag rate; $n_{\text{jet}} \geq 1$
 - Jets clustered using PF particles and Anti-kt with a cone of 0.5; $pT > 25\text{GeV}$; $| \eta | < 2.4$
 - Same sign lepton $\rightarrow n_{\text{jets}} \geq 4$; 3 lepton channel $n_{\text{jets}} \geq 2$
 - ST = scalar sum of jet pT , lepton pT , MET, should be $> 500\text{GeV}$
- Signal selection efficiency:

$M_{b'}$ [GeV/c^2]	cross section [pb]	same-sign dilepton efficiency [%]	yield	trilepton efficiency [%]	yield
350	3.20	1.16 ± 0.15	42	0.33 ± 0.06	12
400	1.41	1.36 ± 0.17	22	0.42 ± 0.06	6.7
450	0.662	1.51 ± 0.18	11	0.45 ± 0.07	3.4
500	0.330	1.57 ± 0.19	5.9	0.48 ± 0.07	1.8
550	0.171	1.80 ± 0.22	3.5	0.57 ± 0.08	1.1

CMS – Search for b' 2/3

PAS-EXO-11-036

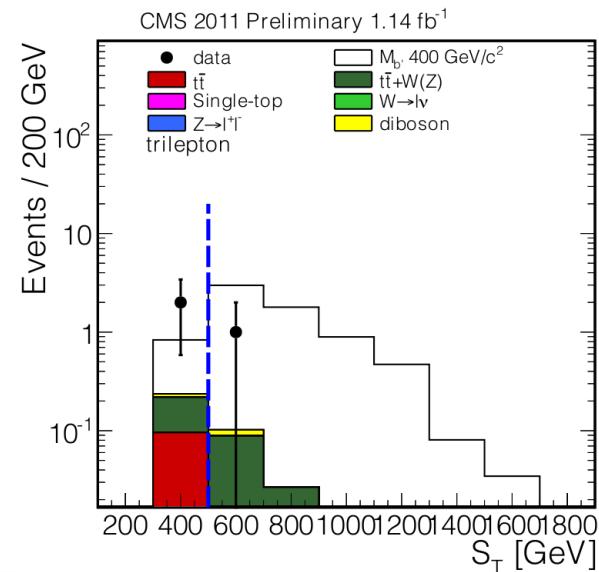

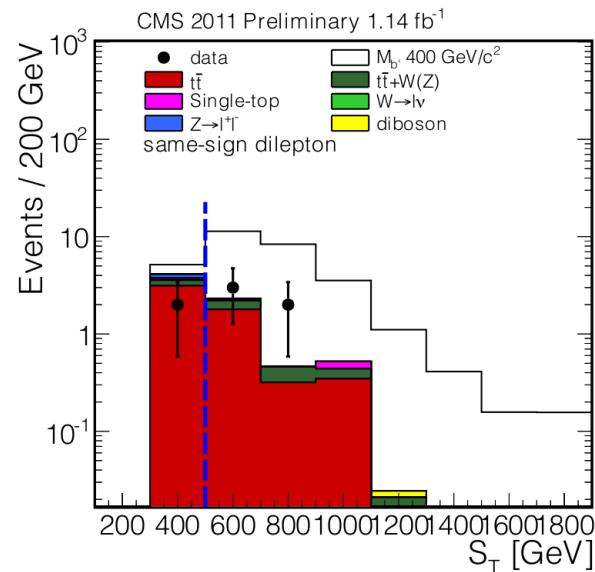

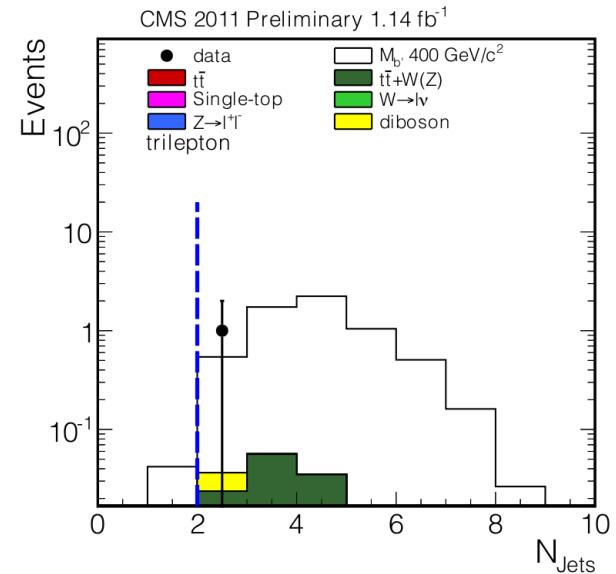

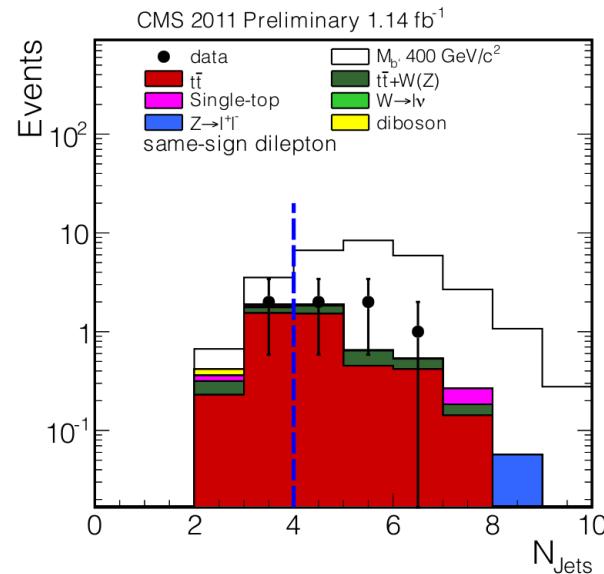

- Backgrounds:**

- Same sign 2 leptons \rightarrow main contribution is from $t\bar{t}$ bar
- 3 leptons; main contribution $t\bar{t}+W(Z)$

- Good modeling of the data, no sign of any excess \rightarrow set limits

- Expected/observed yields:**

	Total BG in signal region	Data
2SS	4.4 +/- 1.4	5
3 lepton	0.16 +/- 0.09	1

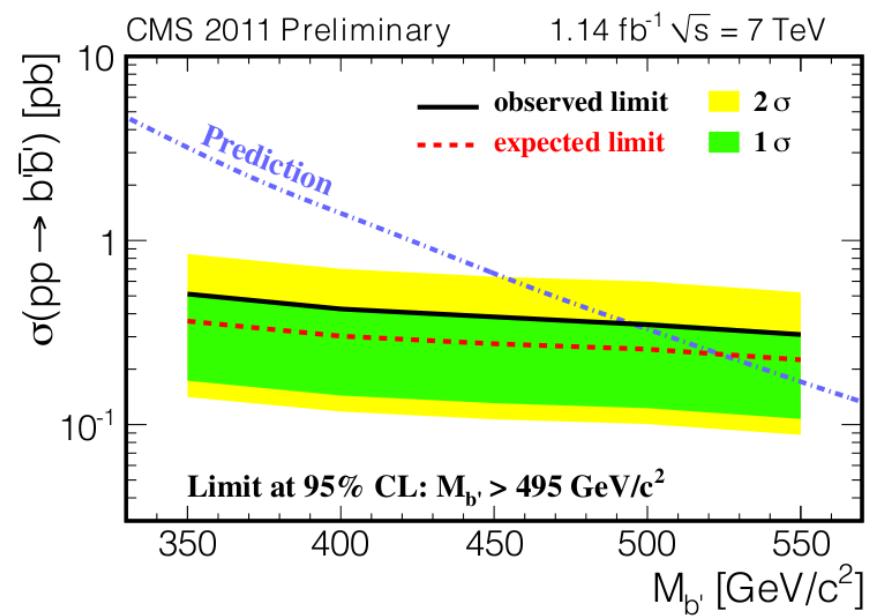

CMS – Search for b' 3/3

PAS-EXO-11-036

- Limits extracted using a cut and count method
- Bayesian method with log-normal prior for integration over the nuisance parameters
- Observed limit: $m(b') > 495 \text{ GeV} @ 95\% \text{ CL}$

ATLAS – Same sign dileptons 1/3

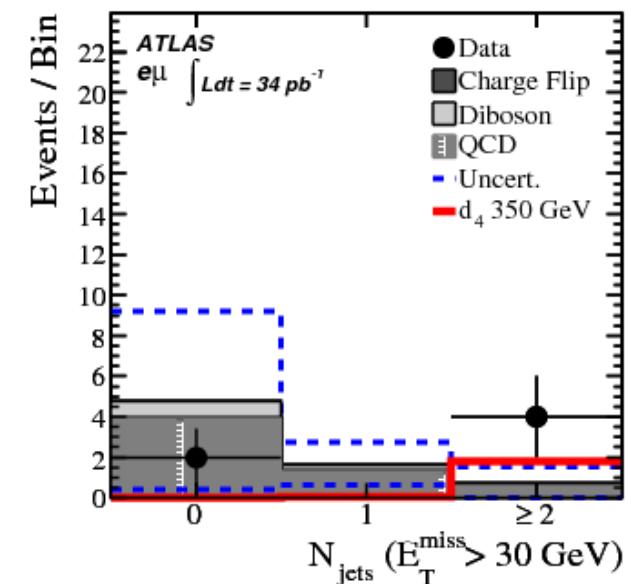

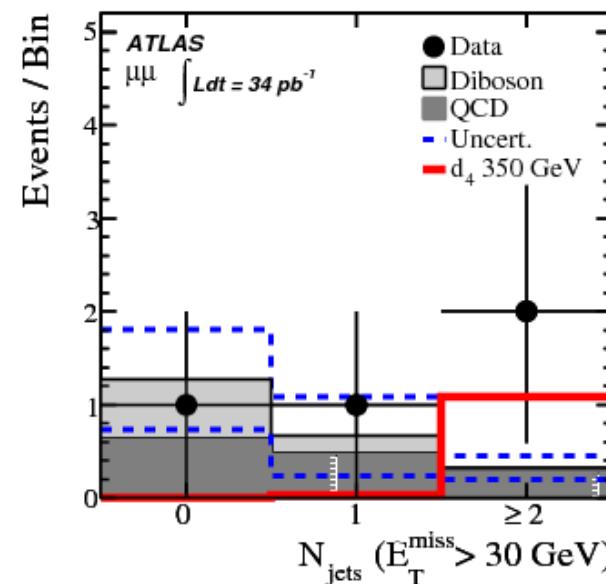

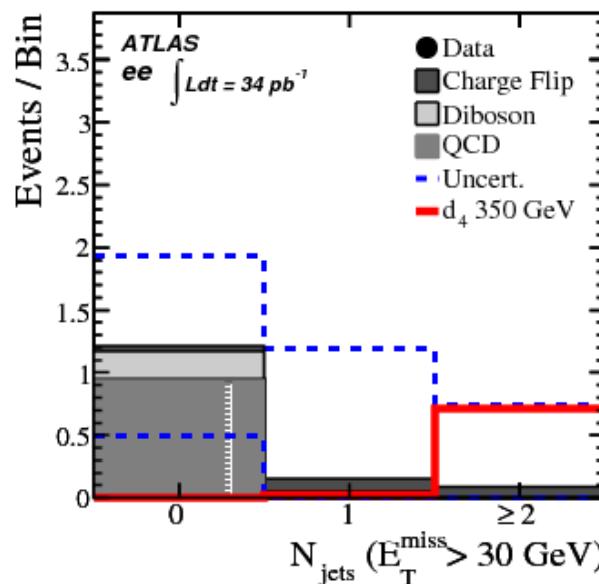

arXiv:1108.0366

- This analysis present the search for two same sign leptons ($ee/e\mu/\mu\mu$)
- Inclusive search for new physics → limits on heavy Majorana neutrinos, UED, b'
- Selection:
 - 2 same sign leptons with tight identification criteria
 - Single lepton trigger
 - Lepton $pT > 20\text{GeV}$; muon $|\eta| < 2.5$; electron $|\eta| < 2.47 \notin 1.37 < |\eta| < 1.52$
 - Lepton isolation: $\sum ET(\Delta R < 0.2) < 0.15 * pT$
 - Jets: Anti-kt 0.4, $pT > 30\text{GeV}$, $|\eta| < 2.5$
 - $\text{ET}_{\text{miss}} > 30\text{ GeV}$

ATLAS – Same sign dileptons 2/3

arXiv:1108.0366

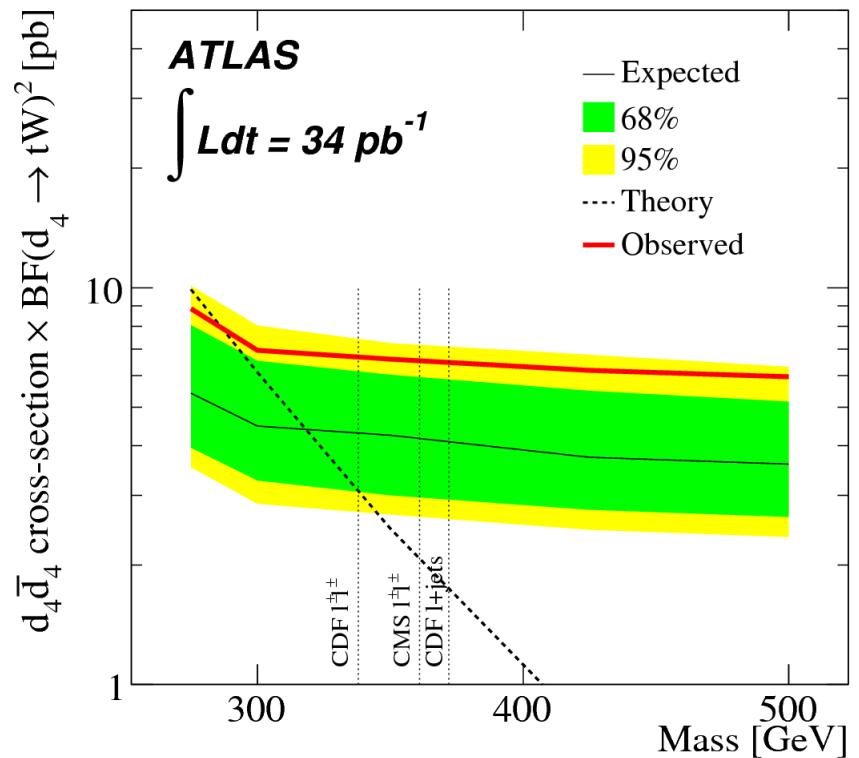

- Background sources in the SM:
 - QCD → jets faking/creating isolated leptons
 - Charge Mis-Identification
 - Diboson → irreducible background
- Data/Monte Carlos modeling is shown in the njet distribution:
 - This is the variable used for limit setting

ATLAS – Same sign dileptons 3/3

arXiv:1108.0366

- A 3 bin template is used for limit setting → njet = 0,1 and ≥ 2
- Limits are set using the Feldman-Cousins prescription
- Confidence level interval are build using a Likelihood ratio test statistic
- Assuming $\text{BR}(b \rightarrow tW) = 1 \rightarrow m(b') > 290\text{GeV}$

CMS – Search for t' dilepton 1/3

PAS-EXO-11-050

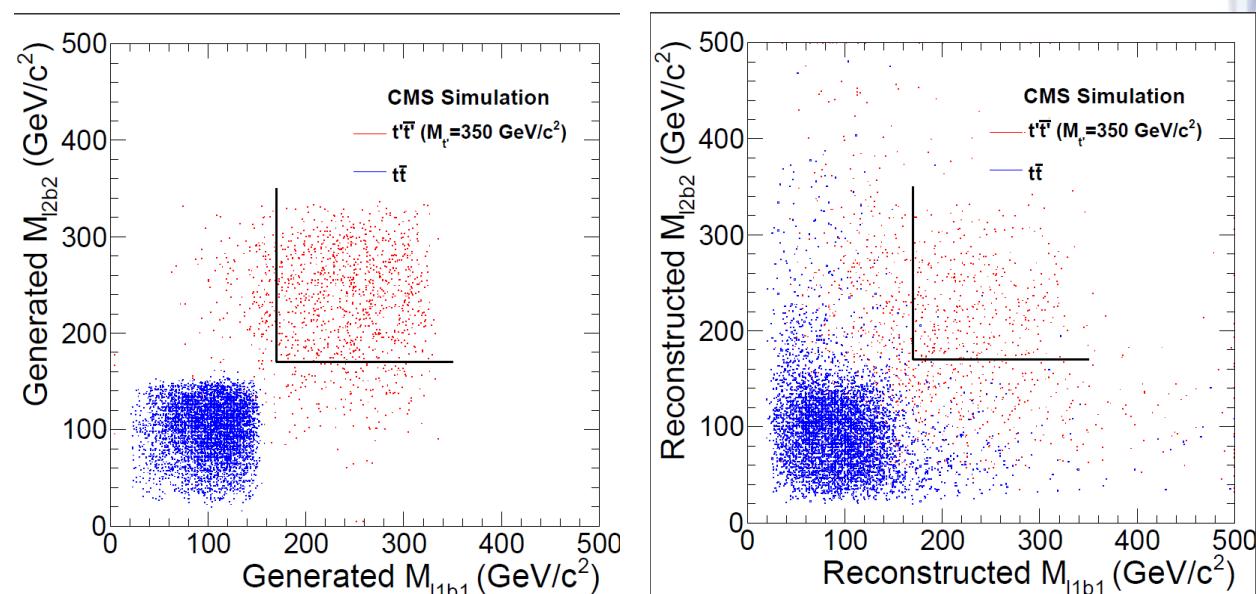

- Search for heavy top-like: $t't' \rightarrow WbWb \rightarrow l\nu b l\nu b$ ($l=e/\mu$)
- Selection:
 - 2 (or more) opposite sign leptons; $pT > 20\text{GeV}$; $| \eta | < 2.4$
 - Dilepton triggers efficiency $\rightarrow 100, 95, 90\%$ for ee, e μ , $\mu\mu$, respectively
 - Lepton isolation $\rightarrow \sum ET(\Delta R < 0.3) < 0.15 * pT$
 - Z mass veto for ee, $\mu\mu \rightarrow$ removed event if $76 < M_{ll} < 106\text{GeV}$ or $M_{ll} < 12\text{GeV}$
 - Jets: Anti-kt R=0.5; $pT > 30\text{GeV}$; $| \eta | < 2.5$ (separated by $\Delta R > 0.4$ from selected leptons)
 - At least 2 jets and at least two of them b-tag
 - ETMiss $> 30\text{GeV}$

CMS – Search for t' dilepton 2/3

PAS-EXO-11-050

- Signal region:
→ after basics selection ttbar dominates...
- The invariant mass of lepton and b-jet is used as discriminant
- At generator level:
→ clear distinction between t' and top
- At reconstruction level:
→ pairing done with $\min(\Delta R)$ between lepton and bjet
- $M_{lb} > 170\text{GeV}$ is applied for the two masses
 - → signal efficiency $\sim 40\%$
 - → ttbar very small...

ATLAS – Search for t' dilepton 1/3

- For this analysis, no assumption about the quark mixing in the final state $t' \rightarrow Wq$
- Baseline selection:
 - Exactly 2 leptons $pT > 20\text{GeV}$; muon $|\eta| < 2.5$; electron $|\eta| < 2.47 \notin 1.37 < |\eta| < 1.52$
 - Lepton isolation: $\sum ET(\Delta R < 0.2) < 4\text{GeV}$
 - Jets: Anti-kt 0.4, $pT > 20\text{GeV}$, $|\eta| < 2.5 \rightarrow$ at least 2 jets
 - $ET_{\text{miss}} > 40\text{ GeV (ee}/\mu\mu)$; $HT(\text{MET+lep } pT) > 130\text{GeV (e}\mu)$
 - For ee/ $\mu\mu \rightarrow M_{ll} > 15\text{GeV}; |M_{ll} - M_Z| > 10\text{GeV}$
- Reconstruction of the heavy quark masses:
 - At high W $pT \rightarrow$ neutrino and lepton \sim collinear
 - Reconstruct both neutrinos by assuming solely contribution to MET
 - Reconstruct $|\Delta\eta(l, \nu)|$ and $|\Delta\Phi(l, \nu)|$ for each neutrino as a free parameter \rightarrow range [0,1]
 - Find the $|\Delta\eta(l, \nu)|$ and $|\Delta\Phi(l, \nu)|$ values and jet assignment that minimizes the differences between the two masses (collinear mass)

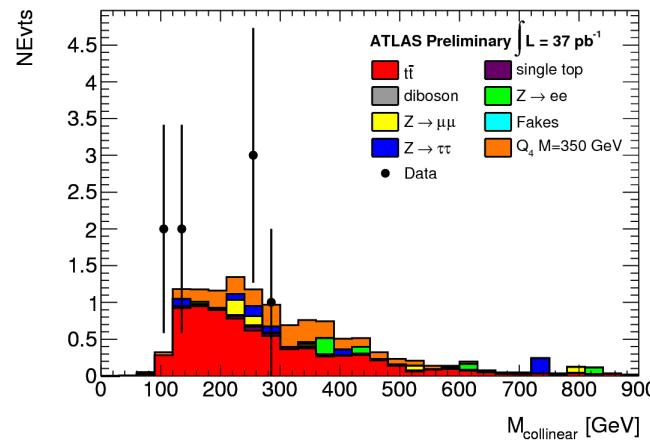

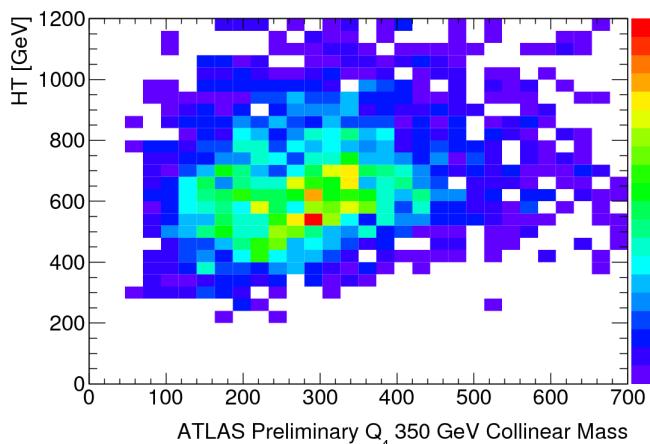

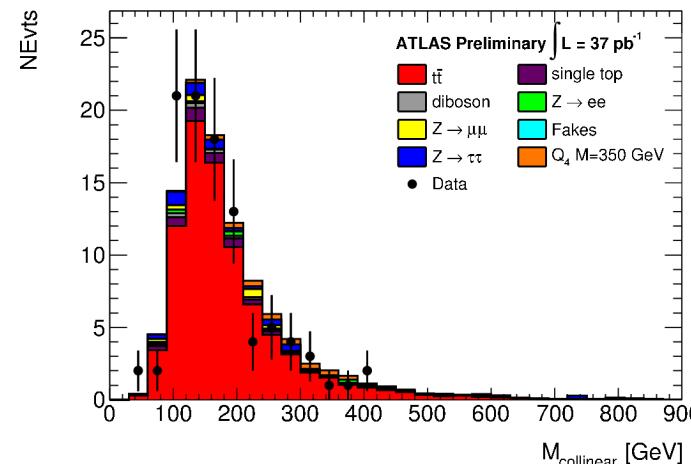

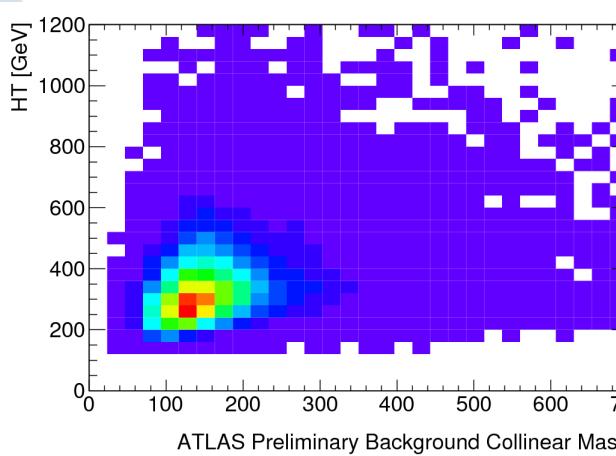

ATLAS-CONF-2011-022

ATLAS – Search for t' dilepton 2/3

ATLAS-CONF-2011-022

Q_4 Mass (GeV)	Final selection
250	$H_T > 500 - 0.7 \times M_{collinear}$
300	$H_T > 600 - 0.5 \times M_{collinear}$
350	$H_T > 600 - 0.2 \times M_{collinear}$
400	$H_T > 700 - 0.3 \times M_{collinear}$

- **Final selection:**
 → triangular cut in the $M_{collinear}$ – HT plane ($= H_{thad} + \text{lepton pT} + \text{MET}$)
- Optimized for each t' mass
 → improve the signal/background discrimination
- → $M_{collinear}$ after triangular cut is used to discriminate signal and background

CMS – Search for t' single-lepton 2/3

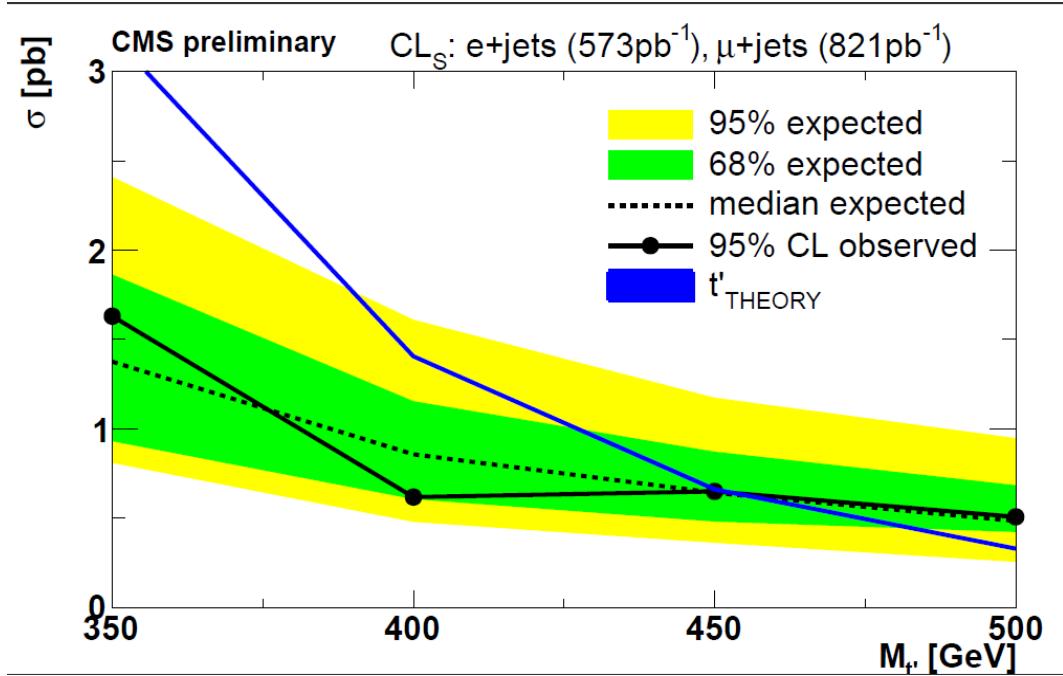

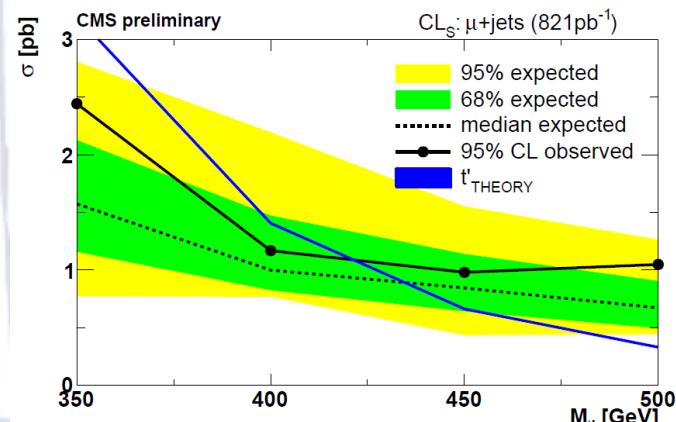

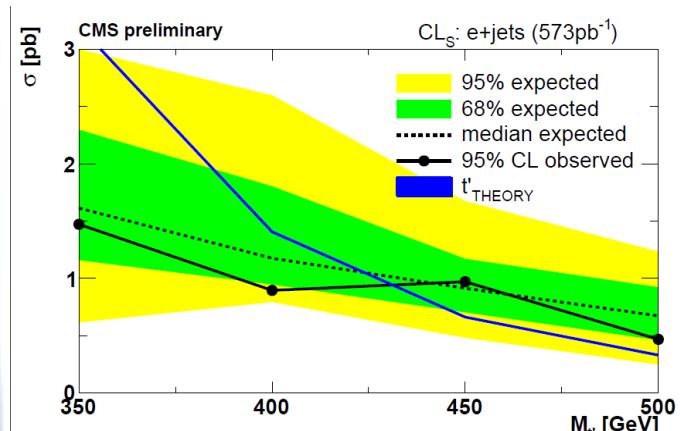

- Mass reconstruction → take four-jet combination out of the hardest 5 jets
- Use the W mass constraint and leptonic/hadronic t' mass should be equal
- A kinematic fit is performed by minimizing a chi2 from the measured momenta of all the particles and their resolutions
- Fitted t' mass is used together with HT → 2D discriminant unfolded in a 1D

CMS – Search for t' single-lepton 3/3

PAS-EXO-11-051

- CLs method used to set limits on the t't' production cross section
- Assuming $\text{BR}(t' \rightarrow Wb) = 1 \rightarrow m(t') > 450\text{GeV} @ 95\%\text{CL}$

ATLAS – Search for t' single-lepton 1/2

Not yet public...

- As in CMS: Final state $t't' \rightarrow WbWb \rightarrow jjb l\nu b$
 - Strategy:
 - Stay as close as possible to the top group selection
 - Relatively low jet pT (60/25/25), and lepton pT (e/mu 25/20)
 - Using the btagging (≥ 1 bjet 70% efficiency, optimize to get best S/sqrt(B))
 - 1D kinematic Likelihood fit
 - Reconstructed top mass
 - 3 jet bin: just the invariant mass of the 3 jets
 - $>=4$ jets: using KLFitter (see many talks about performance)
 - Using leading 4 jets only
 - Floating ‘top’ mass
 - Only constrain both ‘sides’ to be similar
 - Use mclimit package to set CLs limits
 - Modified package:
 - Extrapolation methods
 - Added functionality for running tests et
- Helps to constraint systematics with profiling

ATLAS – Search for t' single-lepton 2/2

Not yet public...

- We treat systematics as nuisance parameters
- ATLAS list of systematics is very conservative respect to CMS (23 sources considered, 13 are profiled; CMS 7 systematics, no ttbar modeling)
- A profile likelihood ratio is performed combining 3jet exclusive/4 jet inclusive channel for at least 1btag jet and electron and muon channels
- Full results will be made public soon (aiming HCP)

CMS – Inclusive search for a 4th generation 1/3

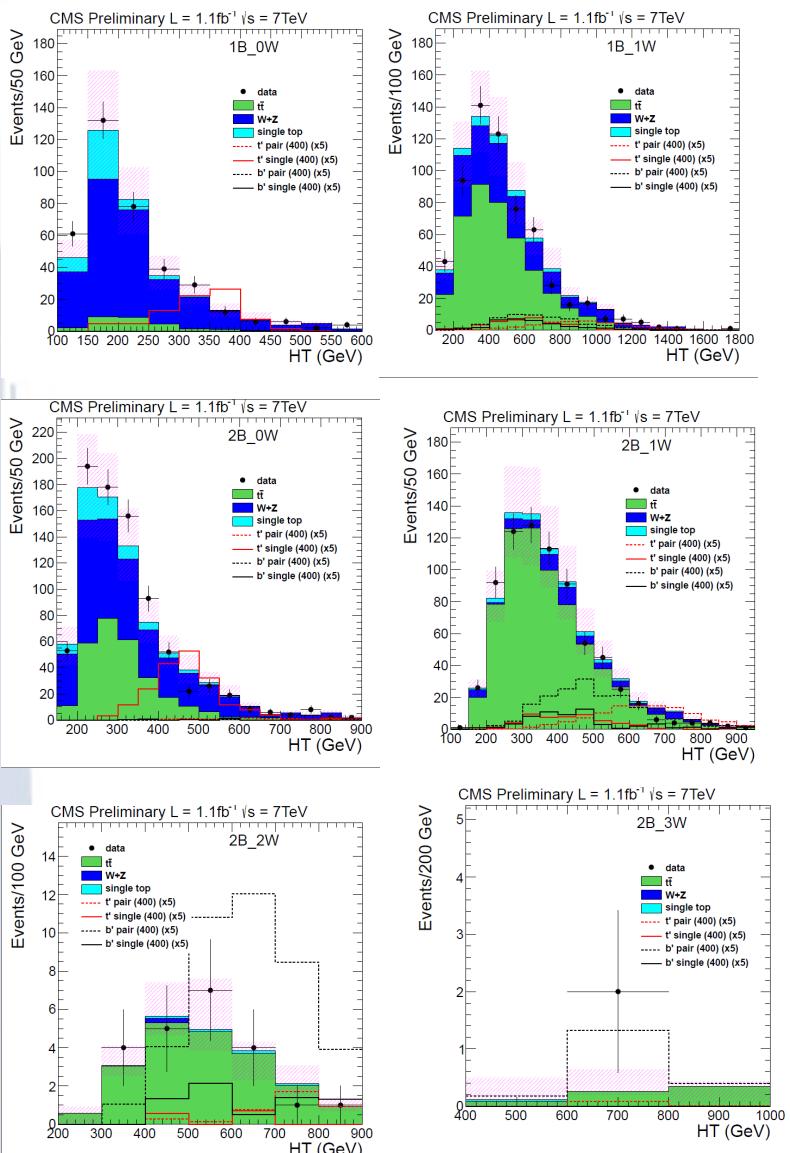

PAS-EXO-11-054

- This analysis presents the inclusive search of 4th generation up-down type quark from pair or single production ($t'b \rightarrow Wb b$; $b't \rightarrow WbW Wb$; $t't' \rightarrow WbWb$; $b'b' \rightarrow WbW WbW$)
- Search is performed in the muon channel:
 - 1 isolated muon $pT > 40 \text{ GeV}$; $|\eta| < 2.1$; veto other isolated muons $pT > 10 \text{ GeV}$, $|\eta| < 2.5$; veto electrons $pT > 20 \text{ GeV}$; $|\eta| < 2.5$
 - Jets $pT > 30 \text{ GeV}$; $|\eta| < 2.5$; ≥ 1 to be a b-tag ($|\eta| < 2.4$ tracker acceptance)
 - MET $> 40 \text{ GeV}$ to reduce QCD multijet
- Search performed in 6 subsamples, based on nb-jet ($=1, \geq 2$) ; nWhad ($=0, =1, =2, \geq 3$)
 - 1B_0W \rightarrow single t' with 1 fwd/1central bjet; $=1$ forward jet ($2.4 < |\eta| < 5$) $pT > 30 \text{ GeV}$
 - 2B_0W \rightarrow single t' with 2central bjets; $=0$ forward jet ($2.4 < |\eta| < 5$) $pT > 30 \text{ GeV}$
 - 1B_1W \rightarrow $t't'$ tt pair production with 1 b-jet failing ID; ≥ 3 jets in addition of the btag
 - 2B_1W
 - 2B_2W
 - 2B_3W

CMS – Inclusive search for a 4th generation 2/3

PAS-EXO-11-054

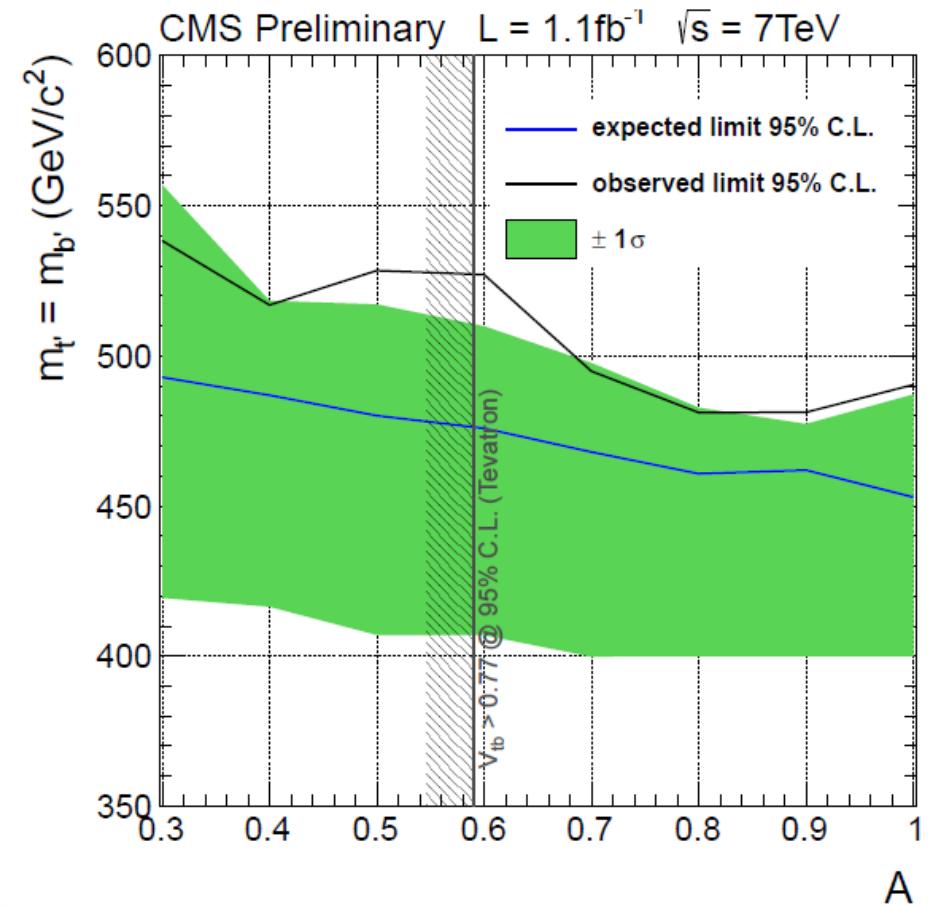

- HT discriminant is used = scalar sum of MET, muon pT, btag jets, Whad pT
- HT is sensitive to the presence of 4th generation quark
- A 4th generation quark would appear in the high tails of the HT distribution
- The 6 channels are combined into a single template histogram
- The 4 different signals processes are added into a single distribution for the signal

CMS – Inclusive search for a 4th generation 3/3

PAS-EXO-11-054

$$\text{CKM4} = \begin{pmatrix} V_{ud} & V_{us} & V_{ub} & V_{ub'} \\ V_{cd} & V_{cs} & V_{cb} & V_{cb'} \\ V_{td} & V_{ts} & V_{tb} & V_{tb'} \\ V_{t'd} & V_{t's} & V_{t'b} & V_{t'b'} \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & \sqrt{A} & \sqrt{1-A} \\ 0 & 0 & \sqrt{1-A} & \sqrt{A} \end{pmatrix}$$

- Different templates of signal are made for each value of A and masses of the new quark
- The results are presented in the plane (A, mq4), where mq4 is the degenerate mass of the quarks, $A = |V_{tb}|^2$
- Using the CLs method is used to set limits together with a profile likelihood template fit
- For minimal off diagonal mixing, ($A \sim 1$) between the third and the fourth generation, $m_t' = m_b' > 490\text{GeV} @ 95\%\text{CL}$

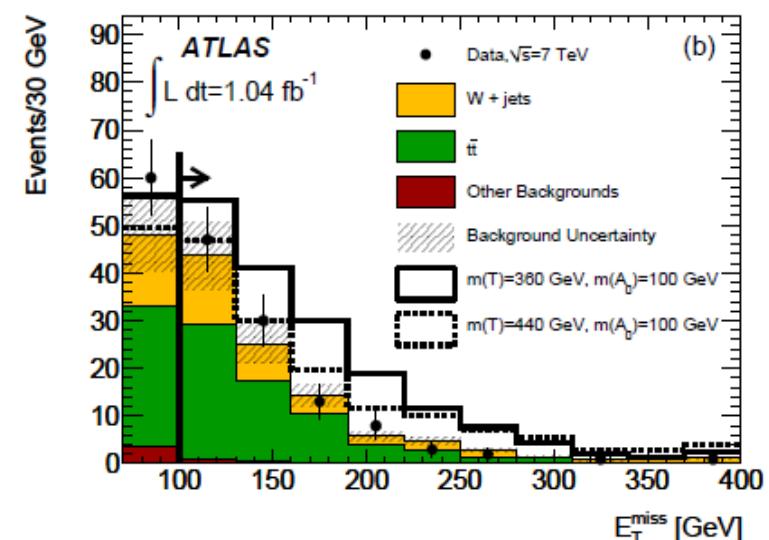

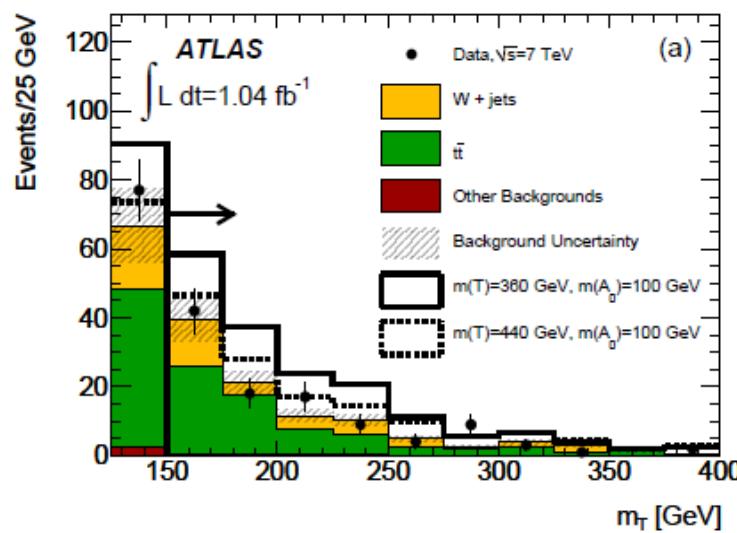

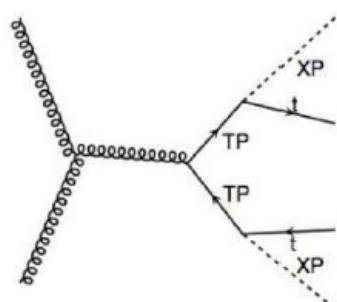

ttbar + Anomalous E_T^{miss} 1/2

arXiv:1109.4725

- Search for anomalous MET in tt (single lepton) events
- Benchmark: TT pair with $T \rightarrow tA_0$
 - A_0 is a dark matter candidate
 - Enhanced cross section due to spin states
- Signal region:
 - $E_T^{\text{miss}} > 100\text{GeV}$, $m_T > 150\text{GeV}$, dilepton veto, $p_T > 15\text{GeV}$, tracks, loose electrons

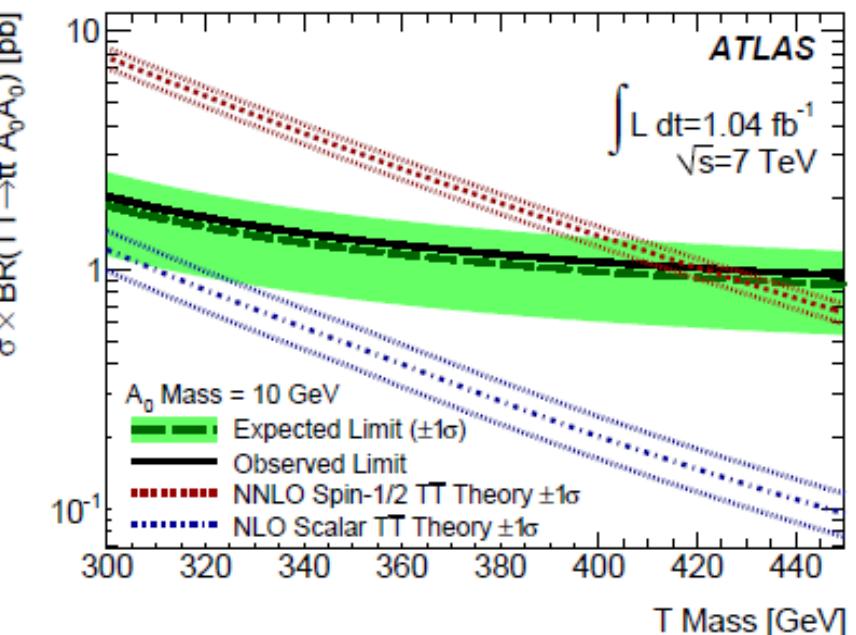

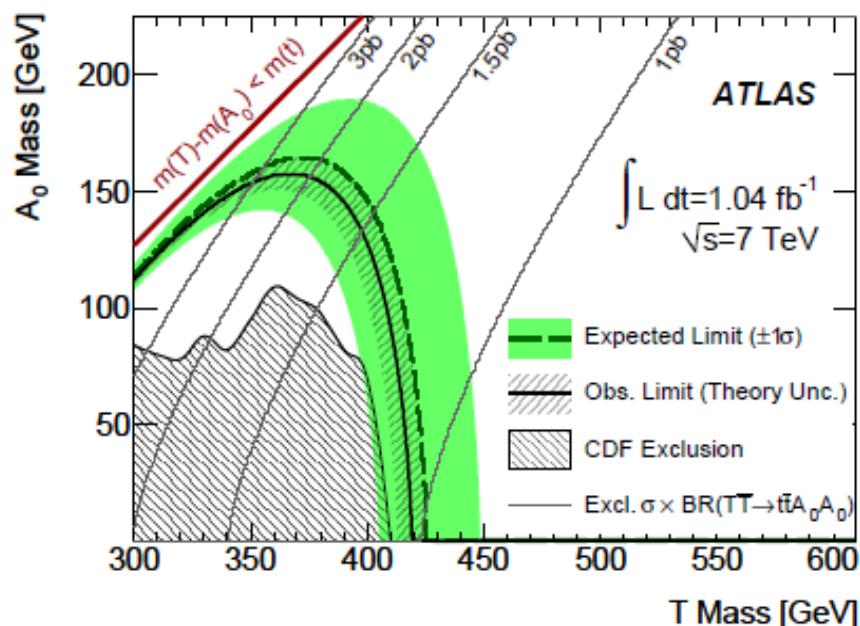

Source	Number of events

ttbar + Anomalous E_T^{miss} 2/2

arXiv:1109.4725

- Assuming $\text{BR}(T \rightarrow t\bar{A}_0) = 1$
- Cut and count method used to set limit using frequentist confidence intervals
- 95% CL limits on TT pair production cross section (depend on A_0 and T masses)
 - $m(T) < 420 \text{ GeV}$ for $m(A_0) < 10 \text{ GeV}$
 - $330 < m(T) < 390 \text{ GeV}$ for $m(A_0) < 140 \text{ GeV}$

Conclusion and Outlook

- ATLAS and CMS have performed the search for new heavy quarks in several decay channels
 - Search for new heavy quarks made a lot of quick progress at LHC
 - Most stringent constraints so far for 4th generation quarks assuming a dominant mixing to the 3rd generation
 - $m(t') > 450\text{GeV}$; $m(b') > 495\text{GeV}$; $m(q4) > 490\text{GeV}$ ($A \sim 1$)
 - Limits on (m_T , A_0) for top partners produced with large MET
 - $m(T) > 400\text{GeV}$ for $m(A_0) < 100\text{GeV}$
- Some analysis still based on 2010 dataset, but are being updated (in the pipeline for approval)
- Improvement expected for Moriond ~ factor of 4 in luminosity
- Heavy quarks are maybe already on tape!!
