

# Status and Future of COMPASS

Polarized Drell-Yan → TMDs universality

Unpolarized SIDIS → TMDs + FFs + flavor separation

DVCS and DVMP → GPDs & Nucleon tomography

Primakoff scattering and  $\pi$  polarizabilities measurement

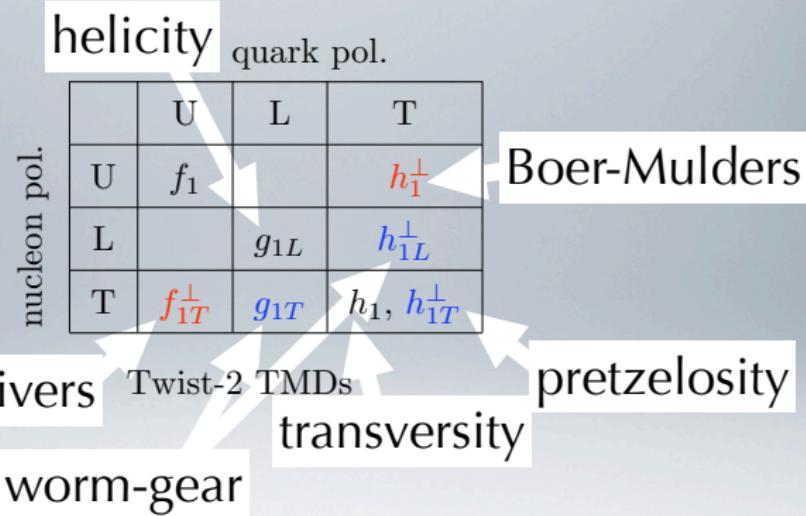

A. Ferrero (CEA/Saclay/SPhN)

*Fall Meeting of the GDR PH-QCD*

Orsay, 20 October 2011

# The present picture of the nucleon

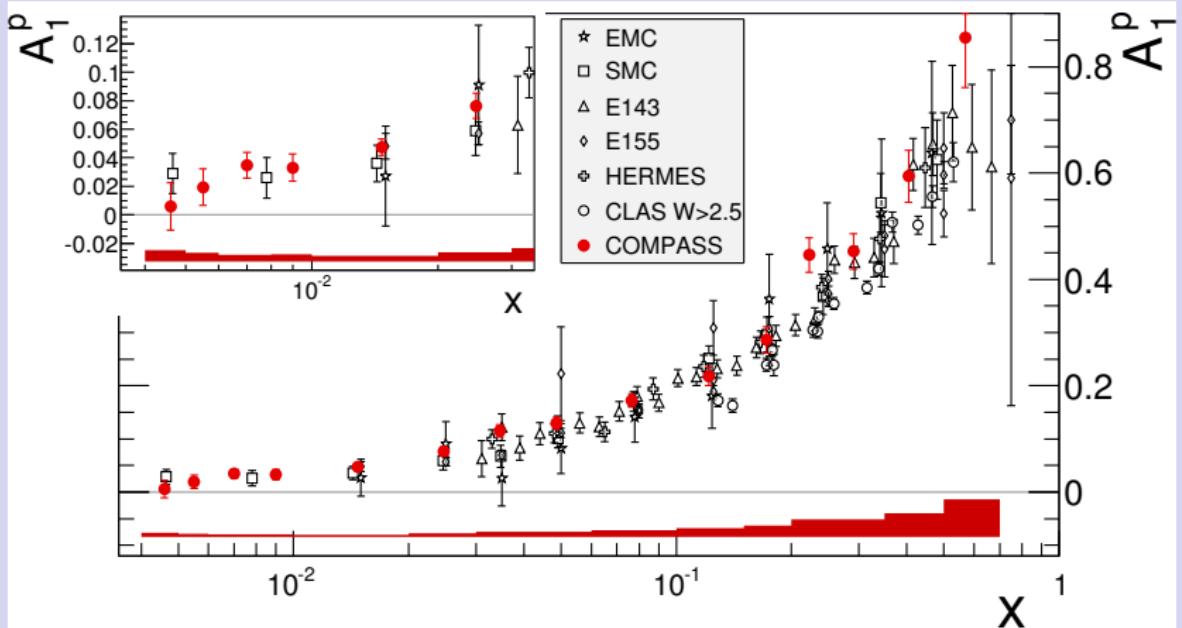

$f_1, g_{1L}, h_1, f_{1T}^\perp \rightarrow$  need of high precision data + flavor separation

$h_{1T}^\perp, g_{1T}, h_{1L}^\perp, h_1^\perp \rightarrow$  unknown or poorly known

# COMPASS Results

## $A_1^p$ Asymmetry

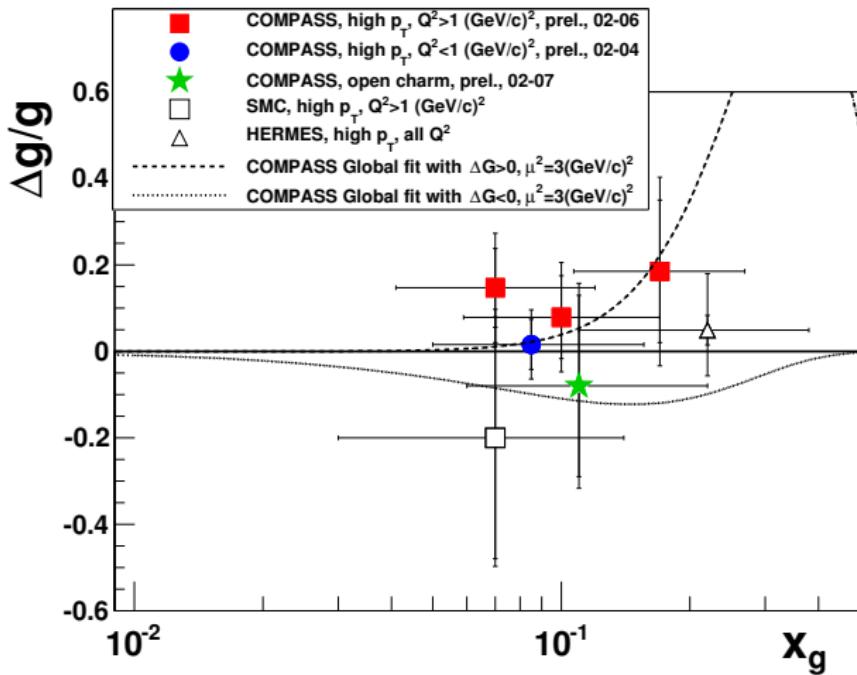

$f_1, g_{1L}, h_1, f_{1T}^\perp \rightarrow$  need of high precision data + flavor separation

$h_{1T}^\perp, g_{1T}, h_{1L}^\perp, h_1^\perp \rightarrow$  unknown or poorly known

# COMPASS Results

## $\Delta G/G$ from high- $p_T$ and open charm

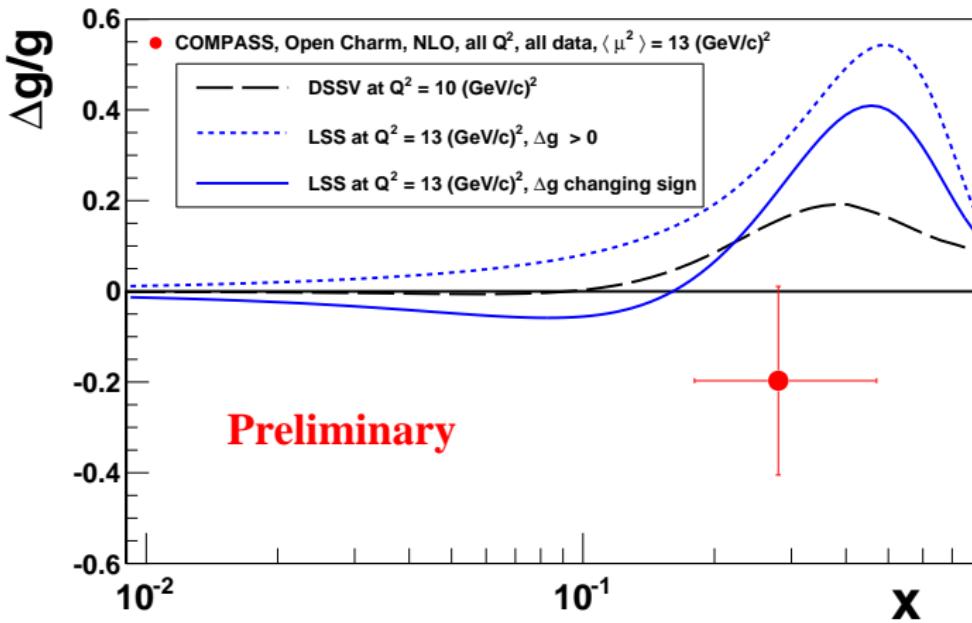

$f_1, g_{1L}$

$h_{1T}^\perp, g_{1T}, h_{1L}^\perp, h_1^\perp \rightarrow \text{unknown or poorly known}$

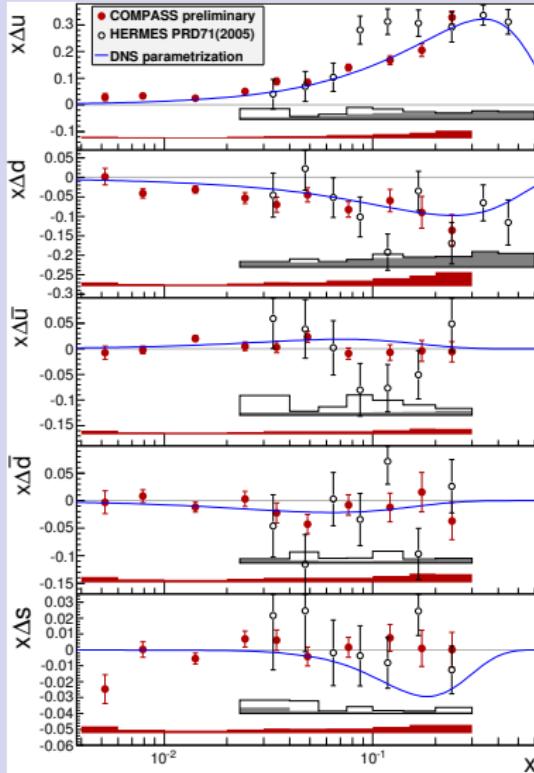

# COMPASS Results

## $\Delta g/G$ from open charm - NLO analysis

# COMPASS Results

## Flavor Separation

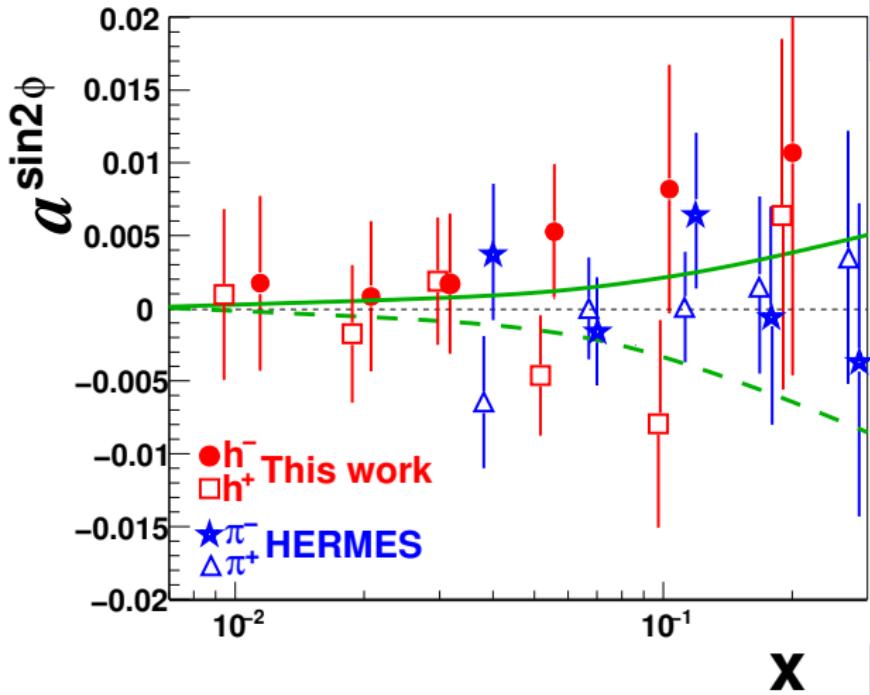

$f_1, g_{1L},$

$h_{1T}^\perp, g_{1T}$

# COMPASS Results

## $\sin(2\phi)$ modulation of $h^\pm$ production

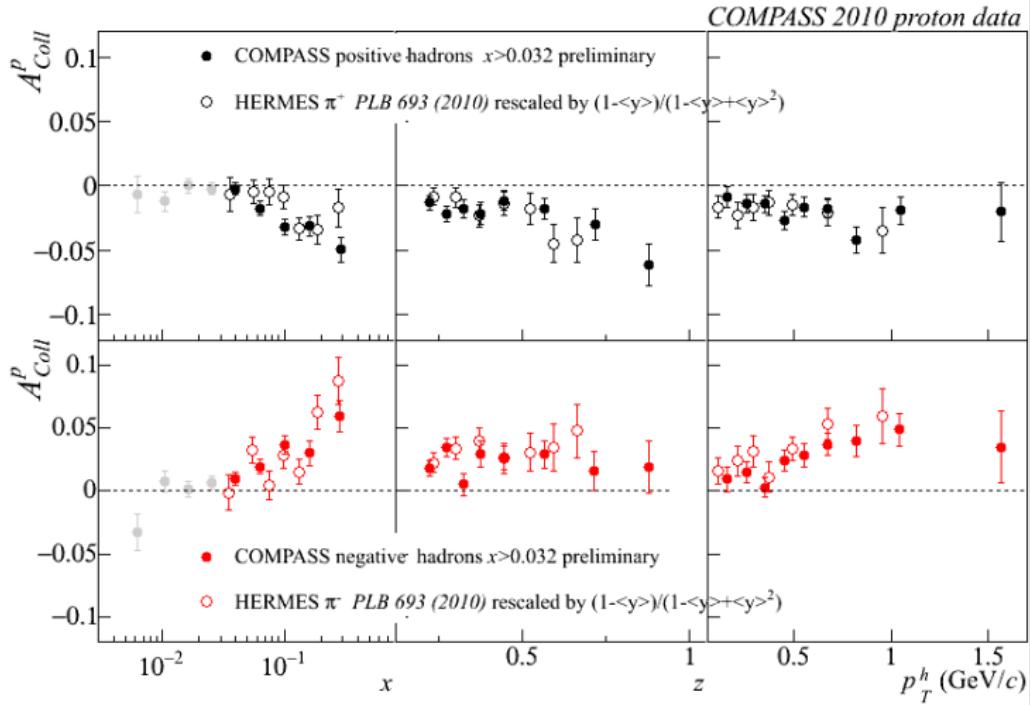

$f_1, g_{1L},$

$h_{1T}^\perp, g_{1T}, n_{1L}, n_1 \rightarrow$  unknown or poorly known

# COMPASS Results

## Collins Asymmetry - 2010 proton data

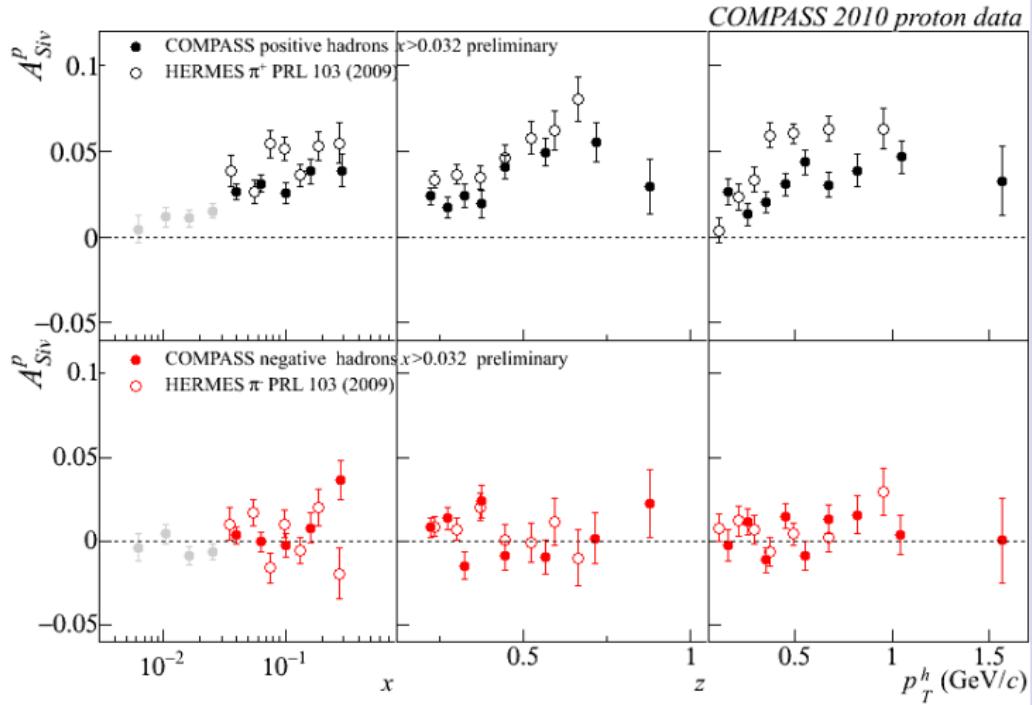

$f_1, g$

$h_{1T}^\perp$

# COMPASS Results

## Sivers Asymmetry - 2010 proton data

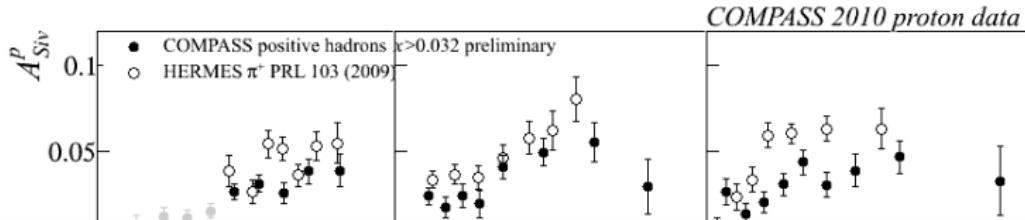

$f_1, g$

$h_{1T}^\perp$

# COMPASS Results

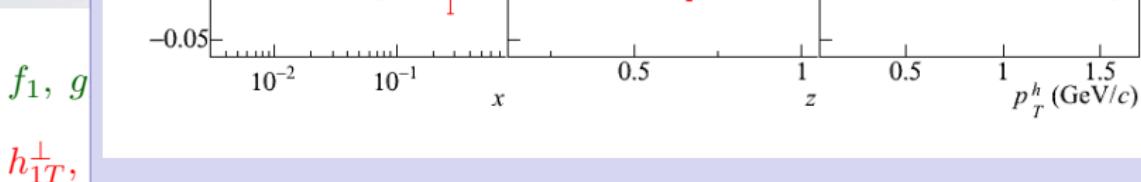

## Sivers Asymmetry - 2010 proton data

Next phase: 2D partonic structure

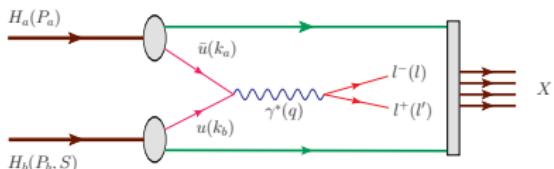

TMDs & GPDs

Drell-Yan with  $\pi^-$  beam and transversely polarized protons:

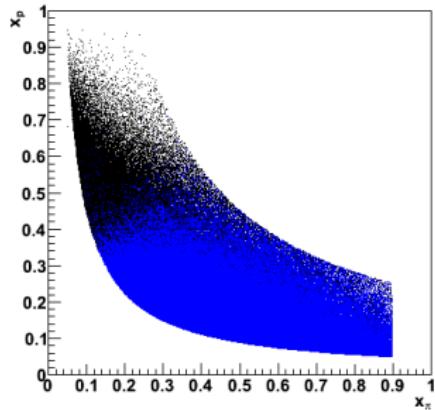

$$\pi^- p^\uparrow \rightarrow \mu^+ \mu^- X$$

COMPASS: 190 GeV  $\pi^-$  beam (up to  $6 \cdot 10^8 \pi/\text{spill}$ )  
Transversely polarized NH<sub>3</sub> target

- Large acceptance for valence region (where SSA are expected to be large)
- $\sigma^{DY}$  dominated by  $\bar{u}/u$  annihilation

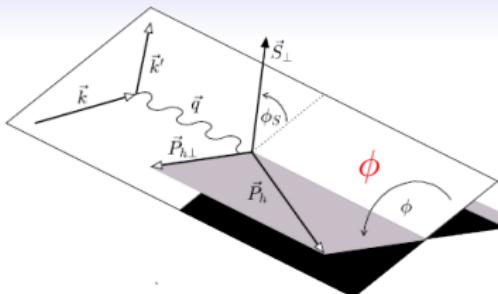

$$\sigma^{DY} \propto f_{\bar{u}|\pi} \otimes f_{u|p}$$

SIDIS  $\rightarrow$  convolution of TMDs with FFs  
DY  $\rightarrow$  convolution of two TMDs

→ Complementary information  
Universality test

- Expansion according to LO quark parton model
- 4 TMDs giving rise to azimuthal modulations:
  - Transversity, Sivers, Boer-Mulders, Pretzelosity
- Convolved with  $f_1$  or Boer-Mulders distributions of the beam pion

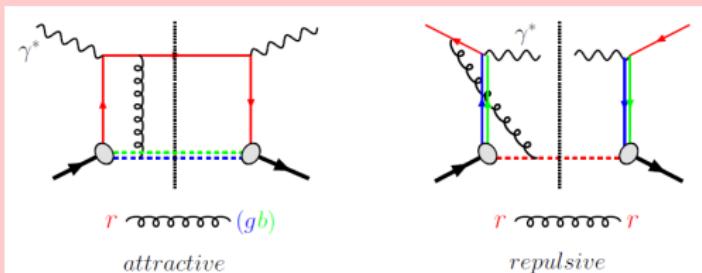

$$\begin{aligned}
 d\sigma(\pi^- p^\uparrow \rightarrow \mu^+ \mu^- X) = & 1 + \bar{h}_1^\perp \otimes h_1^\perp \cos 2\phi \\
 & + |S_T| [ \bar{f}_1 \otimes f_{1T}^\perp \sin \phi_S \\
 & + \bar{h}_1^\perp \otimes h_{1T}^\perp \sin(2\phi + \phi_S) \\
 & + \bar{h}_1^\perp \otimes h_1 \sin(2\phi - \phi_S) ]
 \end{aligned}$$

$\rightarrow (\text{B.-M.})_\pi \otimes (\text{B.-M.})_p$   
 $\rightarrow (f_1)_\pi \otimes (\text{Sivers})_p$   
 $\rightarrow (\text{B.-M.})_\pi \otimes (\text{Pretz.})_p$   
 $\rightarrow (\text{B.-M.})_\pi \otimes (\text{Transv.})_p$

The T-odd character of the Sivers and Boer-Mulders functions implies that their characteristics are process-dependent

In order not to vanish by time-reversal invariance the SSAs require an initial (DY) or final (SIDIS) state interaction of the struck parton

We expect an **opposite sign** in SIDIS and DY:

Sivers:

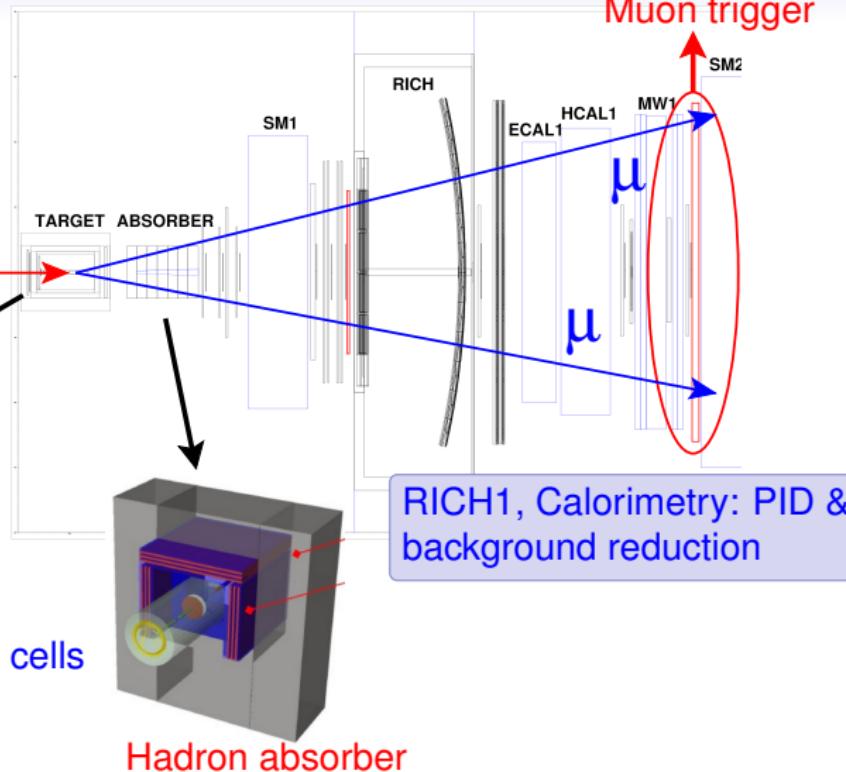

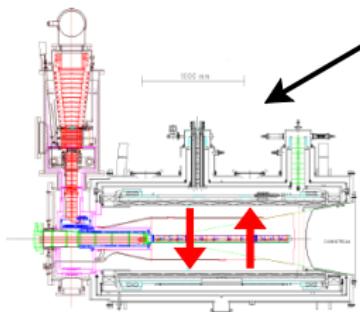

$$f_{1T}^\perp(\text{SIDIS}) = -f_{1T}^\perp(\text{DY})$$

Boer-Mulders:

$$h_1^\perp(\text{SIDIS}) = -h_1^\perp(\text{DY})$$

Crucial test of the factorization approach

$\pi^-$  beam:  
190 GeV  
up to  $6 \cdot 10^8 \pi^-$ /spill

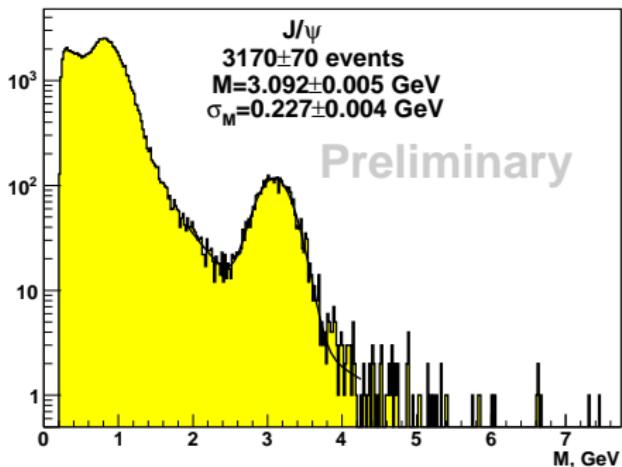

NH<sub>3</sub>, 2 oppositely polarized cells  
~90% polarization

 $\mathbf{h} = K^+, K^-, K^0, \pi^+, \pi^-, \pi^0, \Lambda, \dots \rightarrow$  flavor separation

Projection for 1 week  
with 2.5m LH<sub>2</sub> target

160 GeV muon beam and unpolarized proton target

**Goal:** significant progress in the extraction of **unpolarized PDFs and FFs**

Hadron multiplicities at LO:  $\frac{dN^{\mathbf{h}}(x, z, Q^2)}{dN^{DIS}} = \frac{\sum_q e_q^2 q(x, Q^2) D_q^{\mathbf{h}}(z, Q^2)}{\sum_q e_q^2 q(x, Q^2)}$

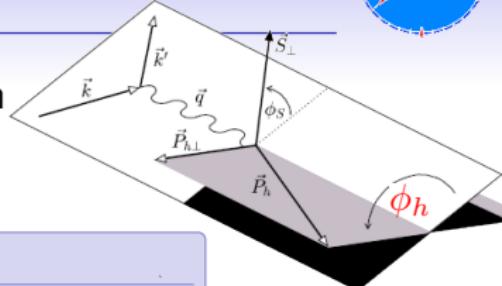

COMPASS: proton target and high-perf. PID (RICH + calorimeters)  
 $\mathbf{h} = K^+, K^-, K^0, \pi^+, \pi^-, \pi^0, \Lambda, \dots \rightarrow$  flavor separation

Final goal: extensive measurement and fine binning in  $(x, Q^2, z, p_T, \dots)$  to provide input to NLO global analysis for PDFs and FFs

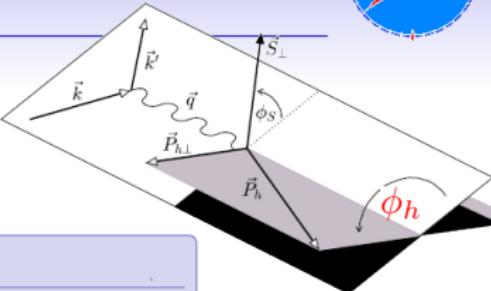

Azimuthal asymmetries in unpolarized SIDIS can reveal quark transverse momentum ( $k_{\perp}$ ) effects beyond the collinear approximation

### Unpolarized cross-section:

$$\frac{d\sigma}{dxdy d\phi} \propto F_{UU} + \epsilon_1 \cos \phi_h F_{UU}^{\cos \phi_h} + \epsilon_2 \cos 2\phi_h F_{UU}^{\cos 2\phi_h} + \lambda_\mu \epsilon_3 \sin \phi_h F_{LU}^{\sin \phi_h}$$

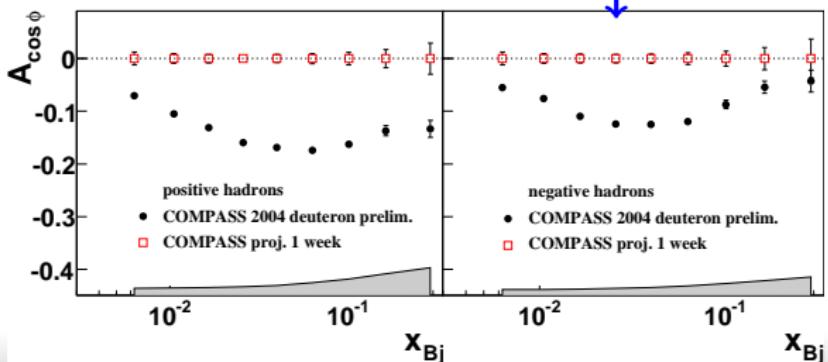

Azimuthal asymmetries in unpolarized SIDIS can reveal quark transverse momentum ( $k_{\perp}$ ) effects beyond the collinear approximation

### Unpolarized cross-section:

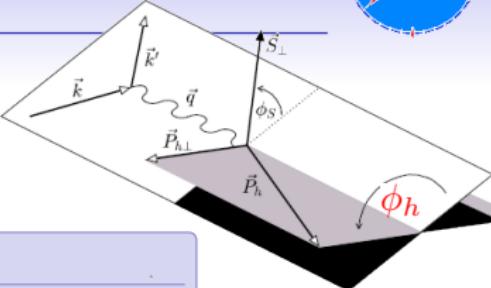

$$\frac{d\sigma}{dxdy d\phi} \propto F_{UU} + \epsilon_1 \cos \phi_h F_{UU}^{\cos \phi_h} + \epsilon_2 \cos 2\phi_h F_{UU}^{\cos 2\phi_h} + \lambda_\mu \epsilon_3 \sin \phi_h F_{LU}^{\sin \phi_h}$$

Cahn effect → info on  $k_{\perp}$

- Compass projected:  
1 week 2.5m LH<sub>2</sub> target
- 2004 Compass deuteron  
4 weeks

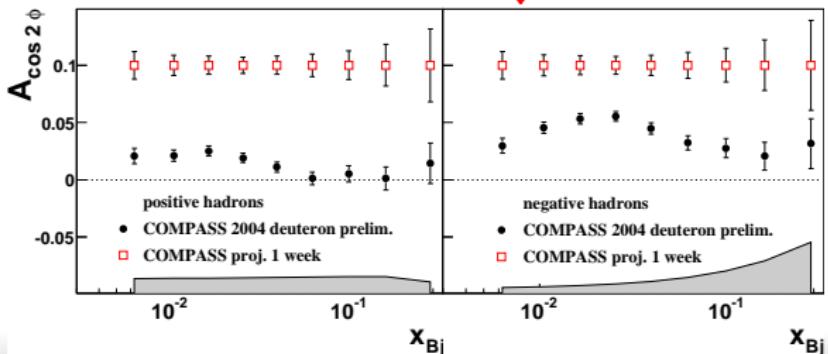

Azimuthal asymmetries in unpolarized SIDIS can reveal quark transverse momentum ( $k_{\perp}$ ) effects beyond the collinear approximation

### Unpolarized cross-section:

$$\frac{d\sigma}{dxdy d\phi} \propto F_{UU} + \epsilon_1 \cos \phi_h F_{UU}^{\cos \phi_h} + \epsilon_2 \cos 2\phi_h F_{UU}^{\cos 2\phi_h} + \lambda_\mu \epsilon_3 \sin \phi_h F_{LU}^{\sin \phi_h}$$

$\epsilon_2 \cos 2\phi_h F_{UU}^{\cos 2\phi_h}$  Boer-Mulders TMD  $\otimes$  Collins FF + Cahn effect

- Compass projected:  
1 week 2.5m LH<sub>2</sub> target
- 2004 Compass deuteron  
4 weeks

### Polarized Drell-Yan experiment @ COMPASS:

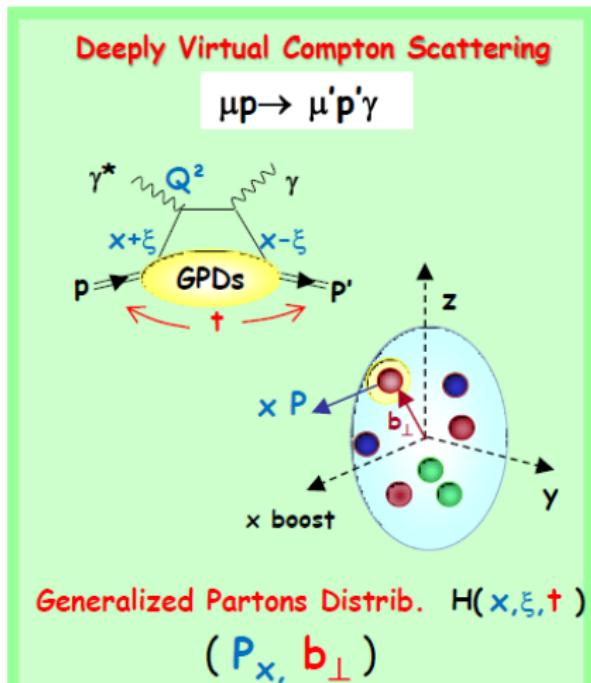

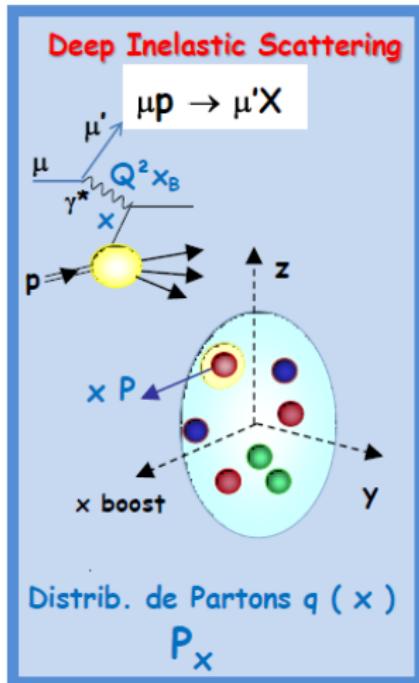

- TMDs universality SIDIS  $\leftrightarrow$  DY
- Sivers and Boer-Mulders sign in DY
- Study of  $J/\Psi$  production mechanism

### DY experiment feasibility proven by 2009 test data

- $J/\Psi$  and DY yields as expected
- Radioprotection scheme validity proven

### High statistics sample of unpol. $\mu p$ scattering data

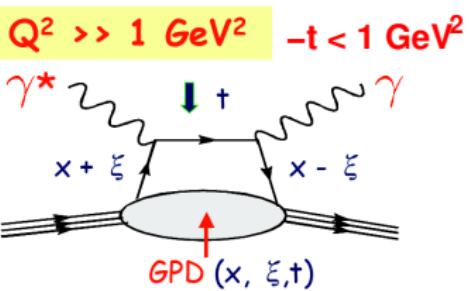

- Identified hadron multiplicities  $\rightarrow$  light and strange quark PDFs and FFs
- Azimuthal asymmetries  $\rightarrow$  TMDs
- Data collected in parallel to GPDs program

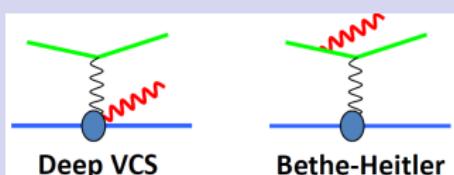

Observation of the Nucleon Structure  
in 1 dimension

in 1+2 dimensions

GPDs can be probed in hard exclusive reactions,  
like Deeply Virtual Compton Scattering (DVCS)

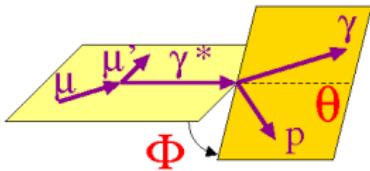

The total cross-section is the coherent sum of DVCS and BH

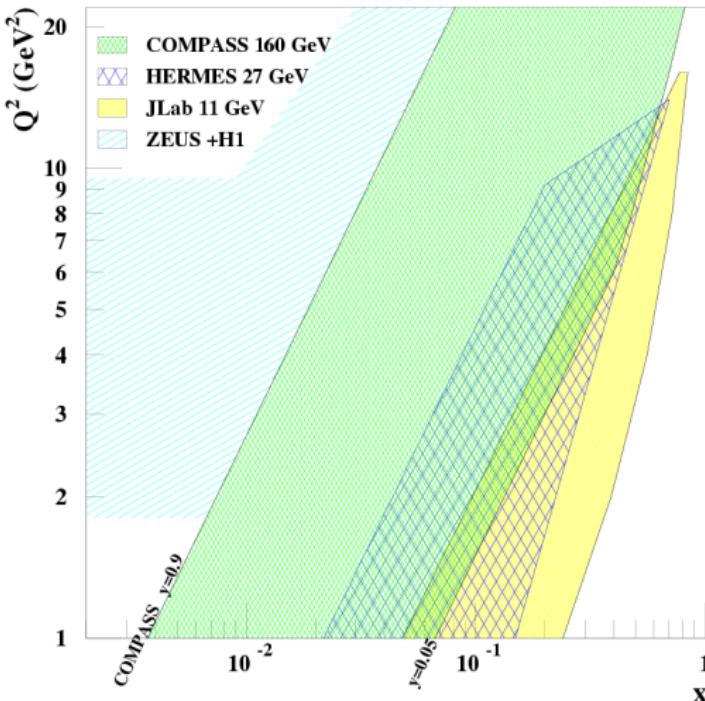

For polarized beam and unpolarized target:

$$\begin{aligned} d\sigma_{\mu p \rightarrow \mu p \gamma} = & d\sigma^{\text{BH}} + d\sigma^{\text{DVCS}}_{\text{unpol}} + P_\mu d\sigma^{\text{DVCS}}_{\text{pol}} + \\ & e_\mu \text{Re}(I) + e_\mu P_\mu \text{Im}(I) \end{aligned}$$

# What Makes COMPASS Unique?

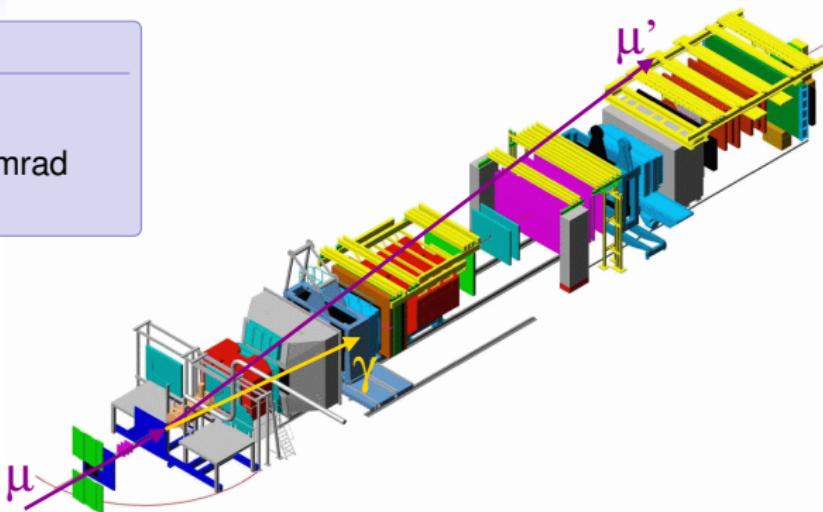

CERN high energy muon beam

- 100 - 190 GeV
- 80% polarization
- $\mu^+$  and  $\mu^-$  beams with opposite polarization
- Uncovered region between ZEUS+H1 and HERMES+Jlab before new colliders may be available
- low  $x_B$ : pure BH (useful for normalization)
- high  $x_B$ : DVCS predominance

### ECAL2

- 3000 channels
- $\sim 0$  mrad to  $\sim 40$  mrad acceptance

### Beam

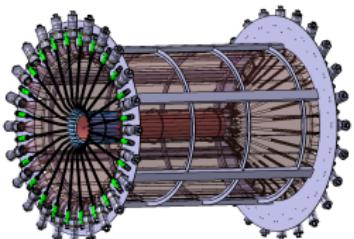

- 100-190 GeV
- 80% polarization
- $\mu^+$  and  $\mu^-$  with opposite polarization

### ECAL1

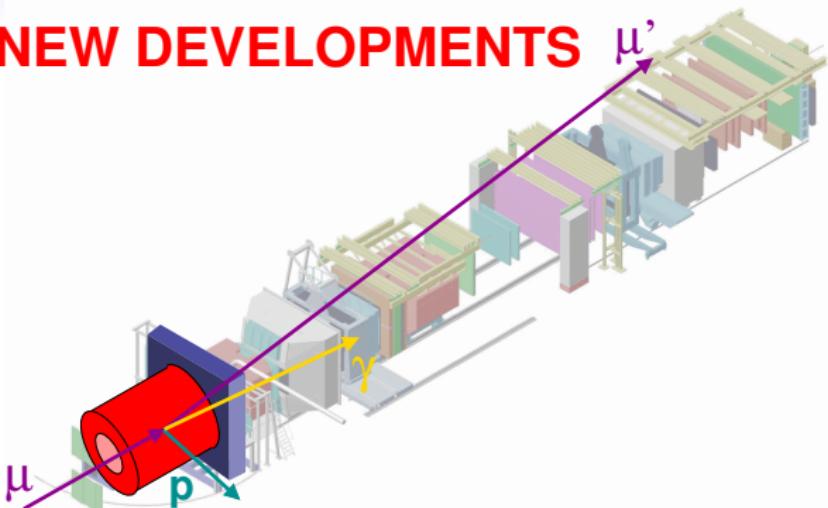

- 1500 channels
- $\sim 40$  mrad to  $\sim 150$  mrad acceptance

## NEW DEVELOPMENTS

### Future Target & RPD

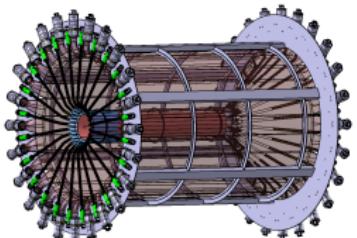

- 2.5m long LH<sub>2</sub> target
- 4m long TOF barrel
- recoil proton ID by TOF and dE/dx
- GANDALF boards:  
**1 GHz** digitization  
ENO: **12bit**

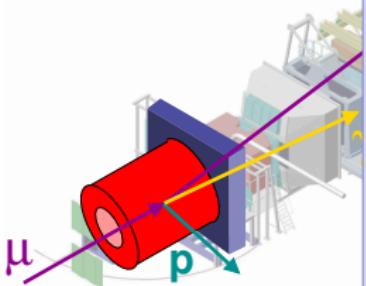

## NEW DEVELOPMENTS $\mu'$

### Future Target & RPD

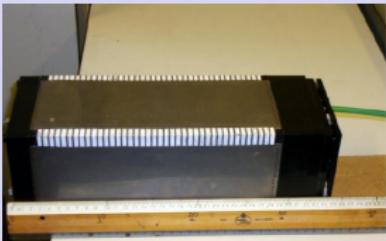

- 2.5m long LH2 target
- 4m long TOF barrel
- recoil proton ID by TOF and  $dE/dx$
- GANDALF boards:  
**1 GHz** digitization  
ENO: **12bit**

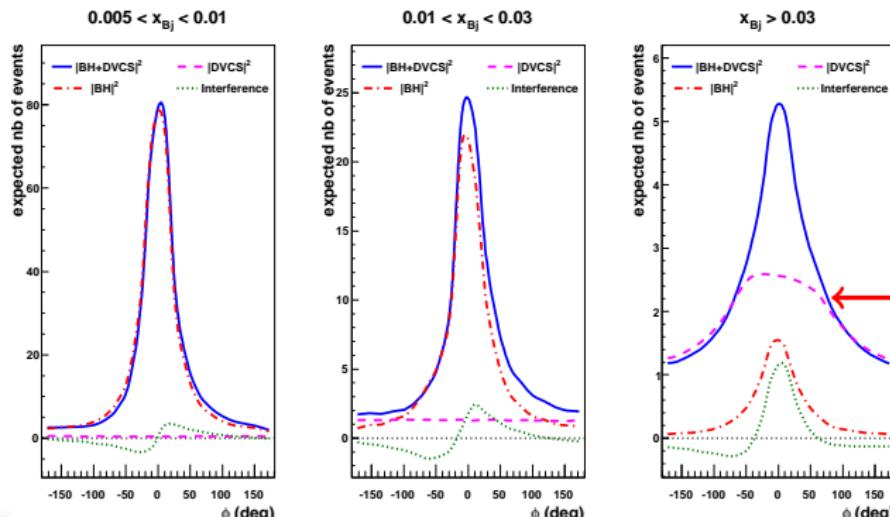

### ECAL0

- Energy range 0.2 - 30 GeV
- $\sim 150$  mrad to  $\sim 300$  mrad
- Thickness < 50 cm
- Resolution  $< 10\%/\sqrt{E}(\text{GeV})$

$$d\sigma \propto |T^{BH}|^2 + \text{Int. Term} + |T^{DVCS}|^2$$

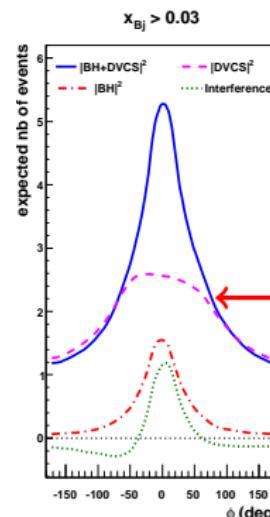

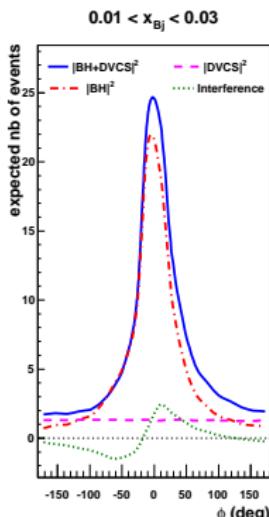

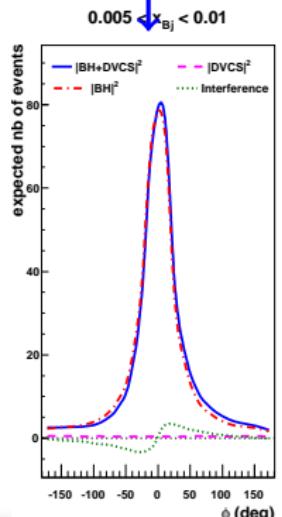

Monte-Carlo simulation for COMPASS set-up with only ECAL1+2

Missing DVCS acceptance  
without ECAL0

$$d\sigma \propto |T^{BH}|^2 + \text{Int. Term} + |T^{DVCS}|^2$$

BH dominance at low- $x_B$

BH dominance at low- $x_B$   
Excellent reference yield and control signal

Monte-Carlo simulation for COMPASS set-up with only ECAL1+2

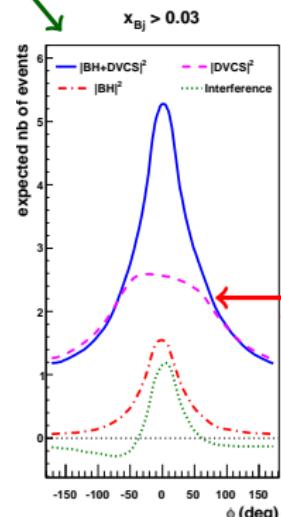

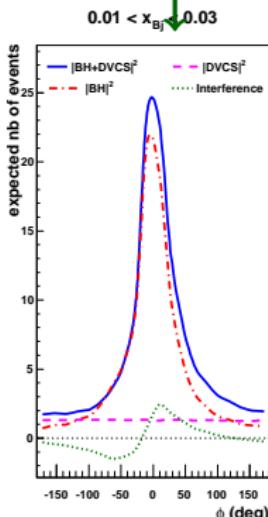

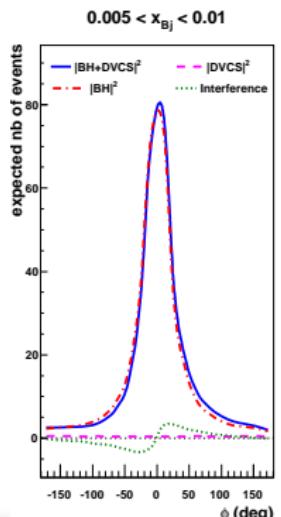

Missing DVCS acceptance  
without ECAL0

$$d\sigma \propto |T^{BH}|^2 + \text{Int. Term} + |T^{DVCS}|^2$$

Int. term → access to  $\text{Re}(T^{DVCS})$  and  $\text{Im}(T^{DVCS})$

$$\text{Re}(T^{DVCS}) \rightarrow P \int dx H(x, \xi, t) / (x - \xi)$$

$$\text{Im}(T^{DVCS}) \rightarrow H(x = \xi, \xi, t)$$

Monte-Carlo simulation for COMPASS set-up with only ECAL1+2

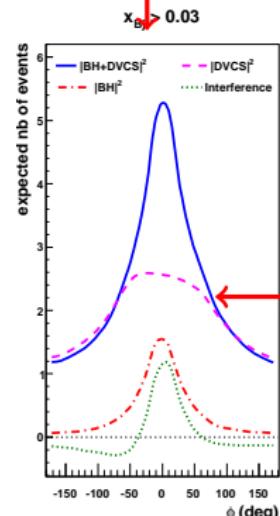

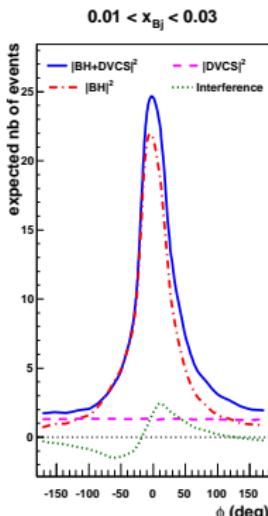

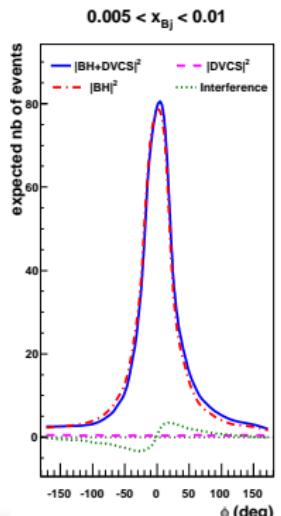

Missing DVCS acceptance without ECAL0

$$d\sigma \propto |T^{BH}|^2 + \text{Int. Term} + |T^{DVCS}|^2$$

↑

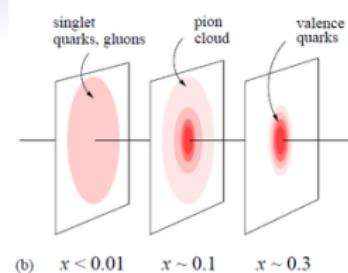

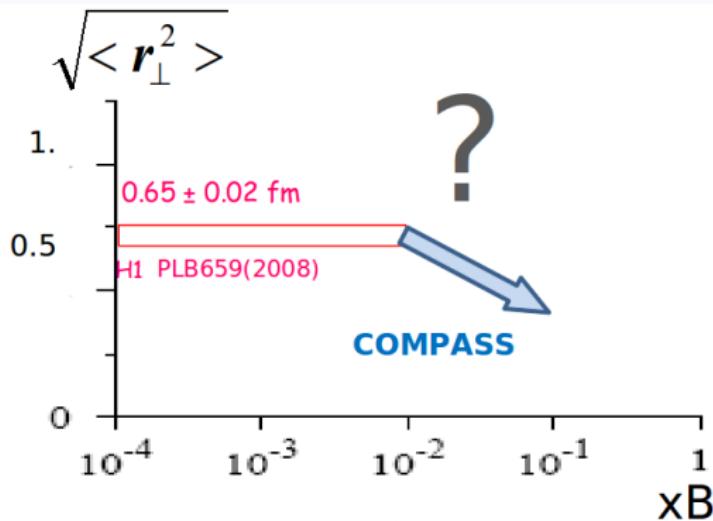

DVCS dominance at large- $x_B$

Transverse nucleon imaging ( $d\sigma^{DVCS}/dt \sim \exp(-B|t|)$ )

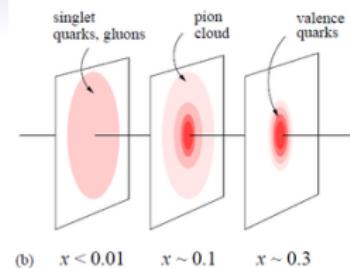

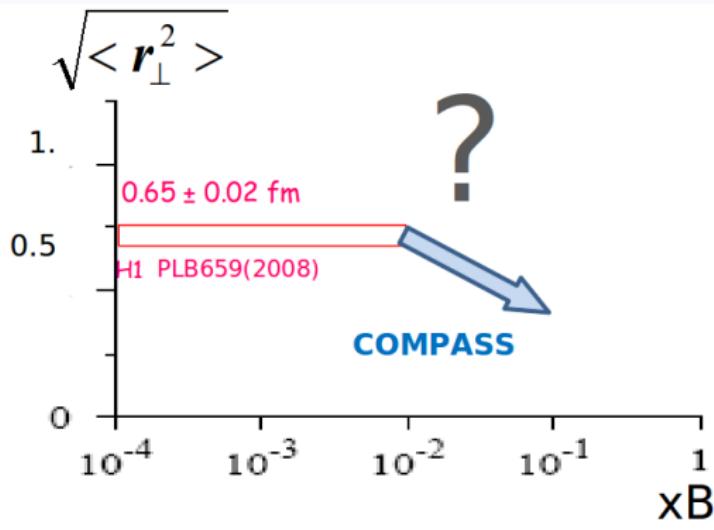

Monte-Carlo simulation for COMPASS set-up with only ECAL1+2

Missing DVCS acceptance without ECAL0

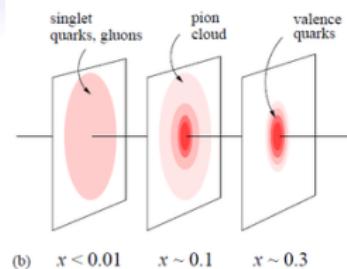

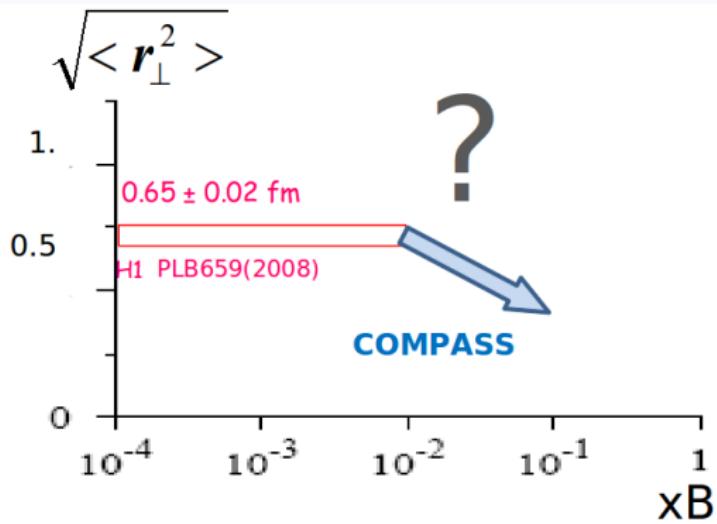

# Transverse Size of the Nucleon (I)

$d\sigma^{DVCS}/dt \sim \exp(-B|t|)$

$B(x_B) = 1/2 <\mathbf{r}_\perp^2(x_B)>$

$\mathbf{r}_\perp \rightarrow \text{Transverse size of the Nucleon}$

$$d\sigma^{DVCS}/dt \sim \exp(-B|t|)$$

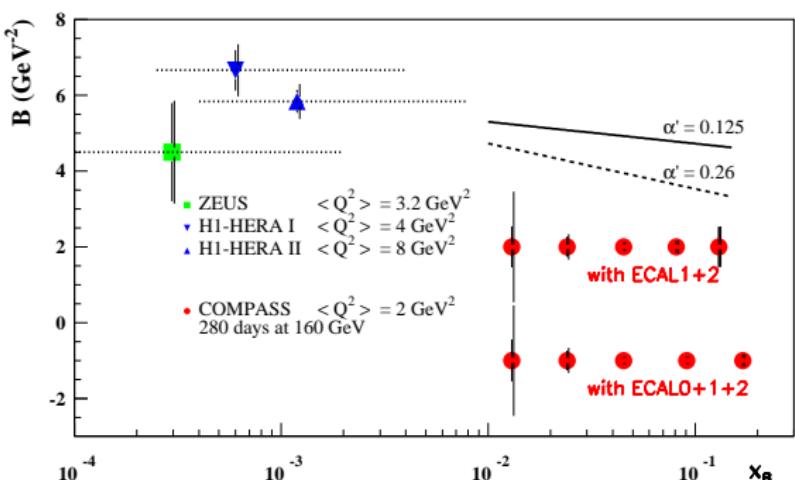

$$B(x_B) = 1/2 <\mathbf{r}_\perp^2(x_B)>$$

$\mathbf{r}_\perp \rightarrow$  Transverse size  
of the Nucleon

The transverse size  $\mathbf{r}_\perp$  as function of  $x_B$  can be extracted  
in a model-independent way from the **t-slope** of the  
measured DVCS cross-section → “Nucleon Tomography”

$$S_{CS,U} \equiv d\sigma(\mu^{+\leftarrow}) + d\sigma(\mu^{-\rightarrow}) \propto d\sigma^{BH} + d\sigma_{unpol}^{DVCS} + e_\mu P_\mu \text{Im}(I)$$

Integrating  $S_{CS,U}$  over  $\phi$  and after subtraction of the BH contribution one obtains  $d\sigma^{DVCS}/dt \sim \exp(-B|t|)$

COMPASS Projected:

- 2 years of data
- eff = 10%
- lumi =  $\sim 10^{32} \text{cm}^{-2} \text{s}^{-1}$

Ansatz at small  $x_B$ :

$$B(x_B) = B_0 + 2\alpha' \ln(x_0/x_B)$$

$\alpha'$  slope of Regge trajct

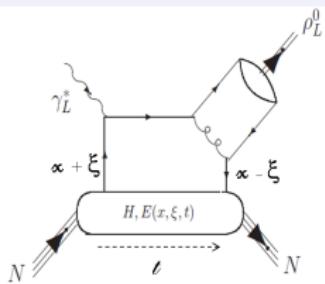

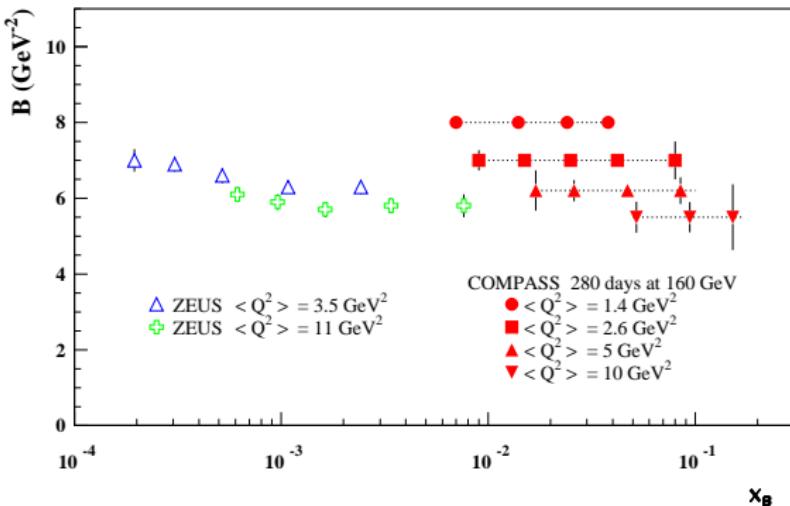

Accuracy  $\geq 2.5\sigma$  if  
 $\alpha' > 0.125$  and full ECALs

Systematic errors dominated by **BH subtraction** at low  $x_B$

# Tranverse Imaging with Vector Mesons

$$d\sigma^{\text{DVMP}}/dt \sim \exp(-B|t|)$$

Red points:

COMPASS  $\rho^0$  projected

- 2 years of data
- eff = 10%
- lumi =  $\sim 10^{32} \text{ cm}^{-2} \text{s}^{-1}$

We are sensitive to the Nucleon size + the transv. meson size

$$Q^2 = 1 \text{ GeV}^2 \quad B \sim 8 \text{ GeV}^{-2}$$

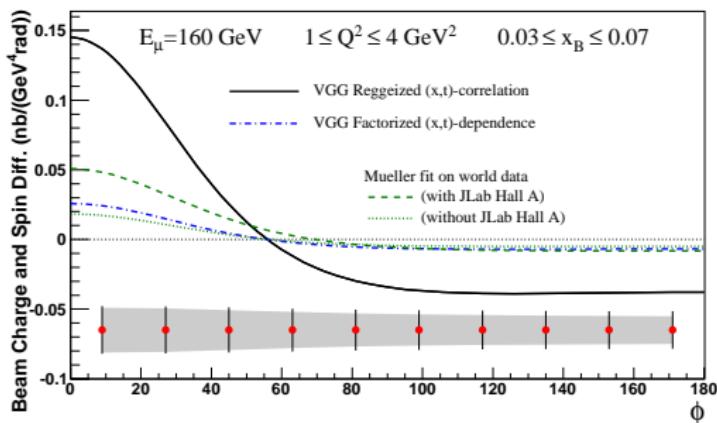

$$Q^2 = 10 \text{ GeV}^2 \quad B \sim 5.5 \text{ GeV}^{-2}$$

$$d\sigma_{\mu p \rightarrow \mu p \gamma} = d\sigma^{\text{BH}} + d\sigma^{\text{DVCS}}_{\text{unpol}} + P_\mu d\sigma^{\text{DVCS}}_{\text{pol}} + e_\mu \text{Re}(I) + e_\mu P_\mu \text{Im}(I)$$

$$d\sigma_{\mu p \rightarrow \mu p \gamma} = d\sigma^{\text{BH}} + d\sigma_{\text{unpol}}^{\text{DVCS}} + P_\mu d\sigma_{\text{pol}}^{\text{DVCS}} + e_\mu \text{Re}(I) + e_\mu P_\mu \text{Im}(I)$$

Combine  $\mu^+$  and  $\mu^-$  data with opposite beam polarizations

**Example:**  $d\sigma\mu^{+\downarrow} - d\sigma\mu^{-\uparrow}$

$$\begin{aligned} D_{\text{CS},U} &\equiv d\sigma\mu^{+\downarrow} - d\sigma\mu^{-\uparrow} \\ &\propto c_0^{\text{Int}} + c_1^{\text{Int}} \cos(\phi) \\ c_{0,1}^{\text{Int}} &\propto \text{Re}(F_1 \mathcal{H}) \end{aligned}$$

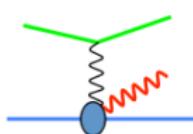

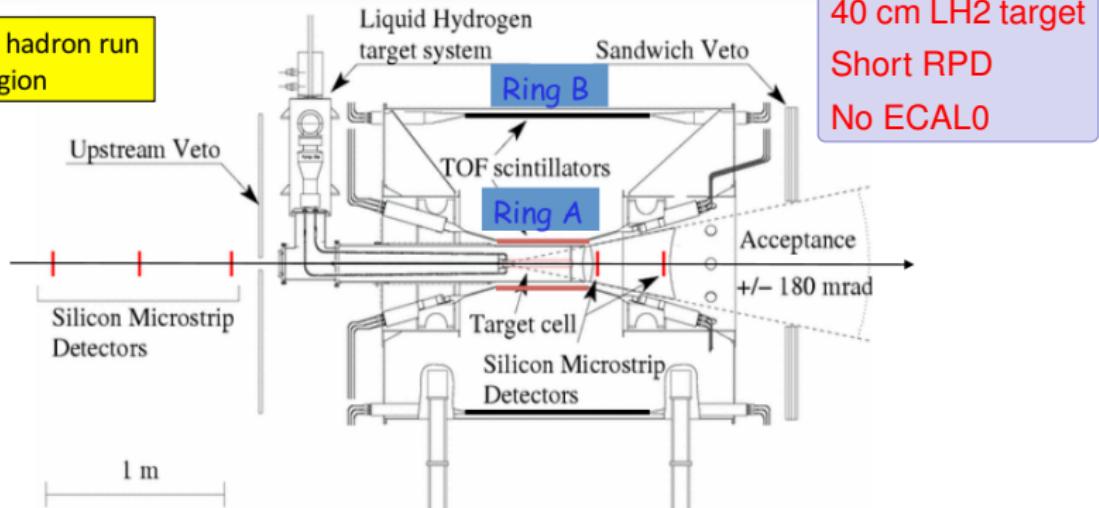

Red points: COMPASS Projected

- 2 years of data
- eff = 10%
- lumi =  $\sim 10^{32} \text{ cm}^{-2} \text{ s}^{-1}$

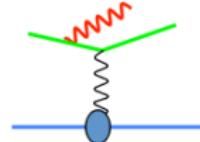

$\text{Re}\mathcal{H}(\xi, t)$  and  $\text{Im}\mathcal{H}(\xi, t) \rightarrow \text{Exp. constrain to GPD H!}$

Syst. error: 3% charge-dependent effect between  $\mu^+$  and  $\mu^-$

Compass hadron run  
Target region

DVCS

Bethe-Heitler

### Selection of events :

- one vertex with  $\mu$  and  $\mu'$
- no other charged tracks
- only 1 high energy photon ( $\Delta t < 5\text{ ns}$ )
- 1 proton in RPD with  $p < 1 \text{ GeV}/c$

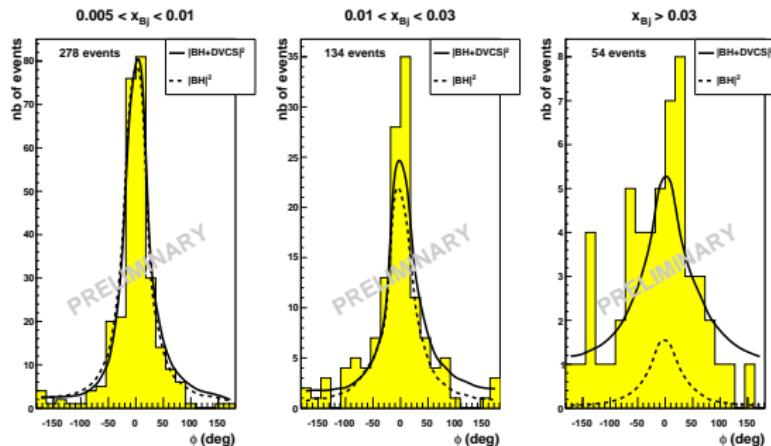

2008: observation of exclusive single photon production

confirmed  $\epsilon_{global} \simeq 10\%$  assumed in simulations

2009: observation of BH and DVCS events

Comparison of MC simulation (solid & dashed lines) with data

**MC yield normalized to low- $x_B$  bin (where BH dominates)**

Excess of data  
at  $x_B > 0.03$   
is a sign for DVCS

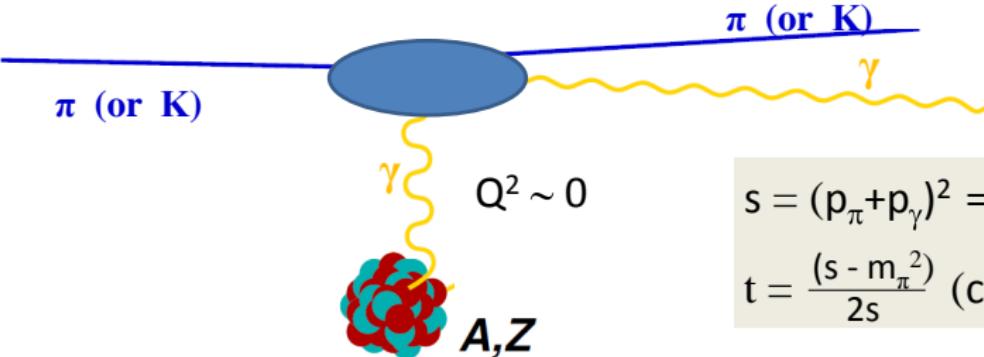

- COMPASS-II will investigate quark GPDs through DVCS
  - **Intermediate  $x_B$  regime** not accessible to present or planned facilities in the near future
  - Two beam charges available with opposite polarizations  
**access to real and imaginary parts of DVCS amplitude**

Constrain **GPD H** through  $\phi$  dependence of  $D_{CS,U}$  and  $S_{CS,U}$

- Nucleon **transversal dimension** as function of  $x_B$   
("Nucleon Tomography")
- Complementary information from exclusive meson production
- In a second phase, constrain of **GPD E** by using a transversely polarized target

# QCD at low energy:

## Primakoff experiments with $\pi$ , K or inverse Compton Scattering on $\pi$ , K

$$s = (p_\pi + p_\gamma)^2 = (\pi\gamma \text{ CM energy})^2$$

$$t = \frac{(s - m_\pi^2)}{2s} (\cos \vartheta_{\text{cm}} - 1)$$

The chiral perturbation theory (ChPT) predicts the low-energy behavior of the cross section with  $s$  varying from threshold ( $m_\pi^2$ ) to a few  $m_\pi^2$

$$\frac{d\sigma_{\pi\gamma}}{d\Omega_{\text{cm}}} = \left[ \frac{d\sigma_{\pi\gamma}}{d\Omega_{\text{cm}}} \right]_{\text{point-like}} + C \cdot \frac{(s - m_\pi^2)}{s^2} \cdot \mathcal{P}_{(\alpha_\pi, \beta_\pi)}$$

**Deviation due to  $\pi$  polarisabilities**

*the point-like cross section is measured with the muon beam*

# Summary for Primakoff @ COMPASS

$\alpha_\pi, \beta_\pi, \alpha_2 - \beta_2$  polarisabilities measured for the first time in  $\gamma + \pi \rightarrow \pi + \gamma$

in 120 days 90 days for $\pi$ beam 30 days for $\mu$ beam	$\alpha_\pi - \beta_\pi$ in $10^{-4} \text{ fm}^3$	$\alpha_\pi + \beta_\pi$ in $10^{-4} \text{ fm}^3$	$\alpha_2 - \beta_2$ in $10^{-4} \text{ fm}^5$
2-loop ChPT prediction	$5.70 \pm 1.0$	$0.16 \pm 0.10$	16
experimental accuracy	$\pm 0.66$	$\pm 0.025$	$\pm 1.94$

→ clear sensitivity to ChPT parameters in COMPASS kinematics

in parallel: chiral anomaly  $F_3$  in  $\gamma + \pi \rightarrow \pi + \pi^0$
