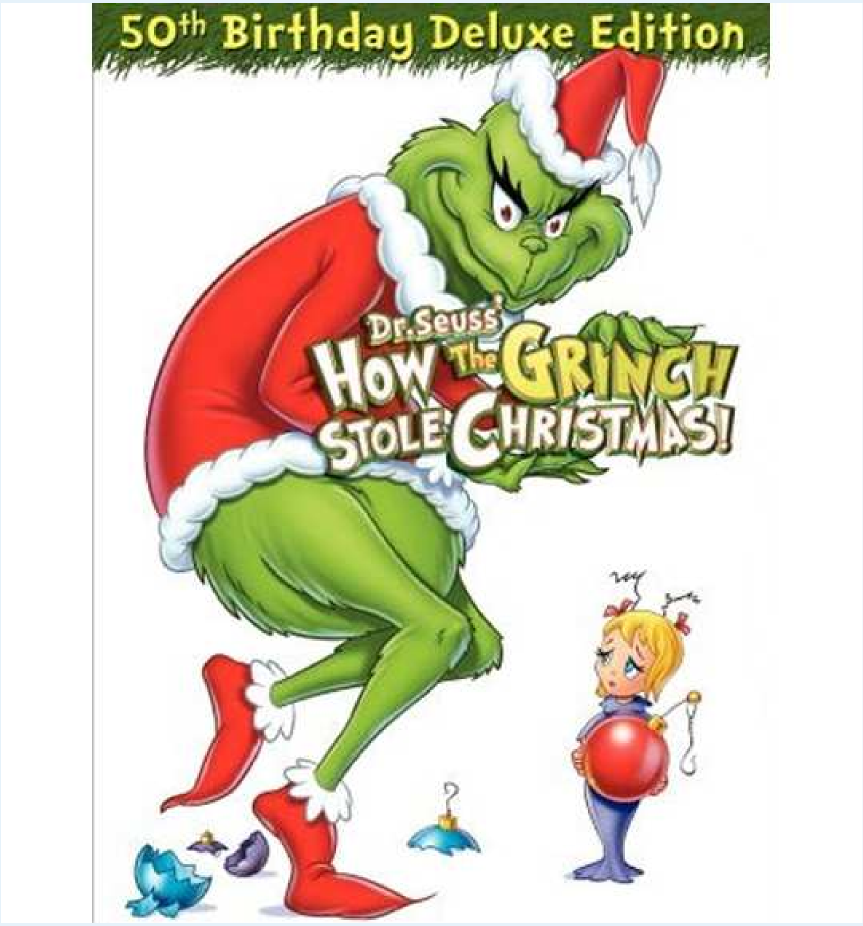
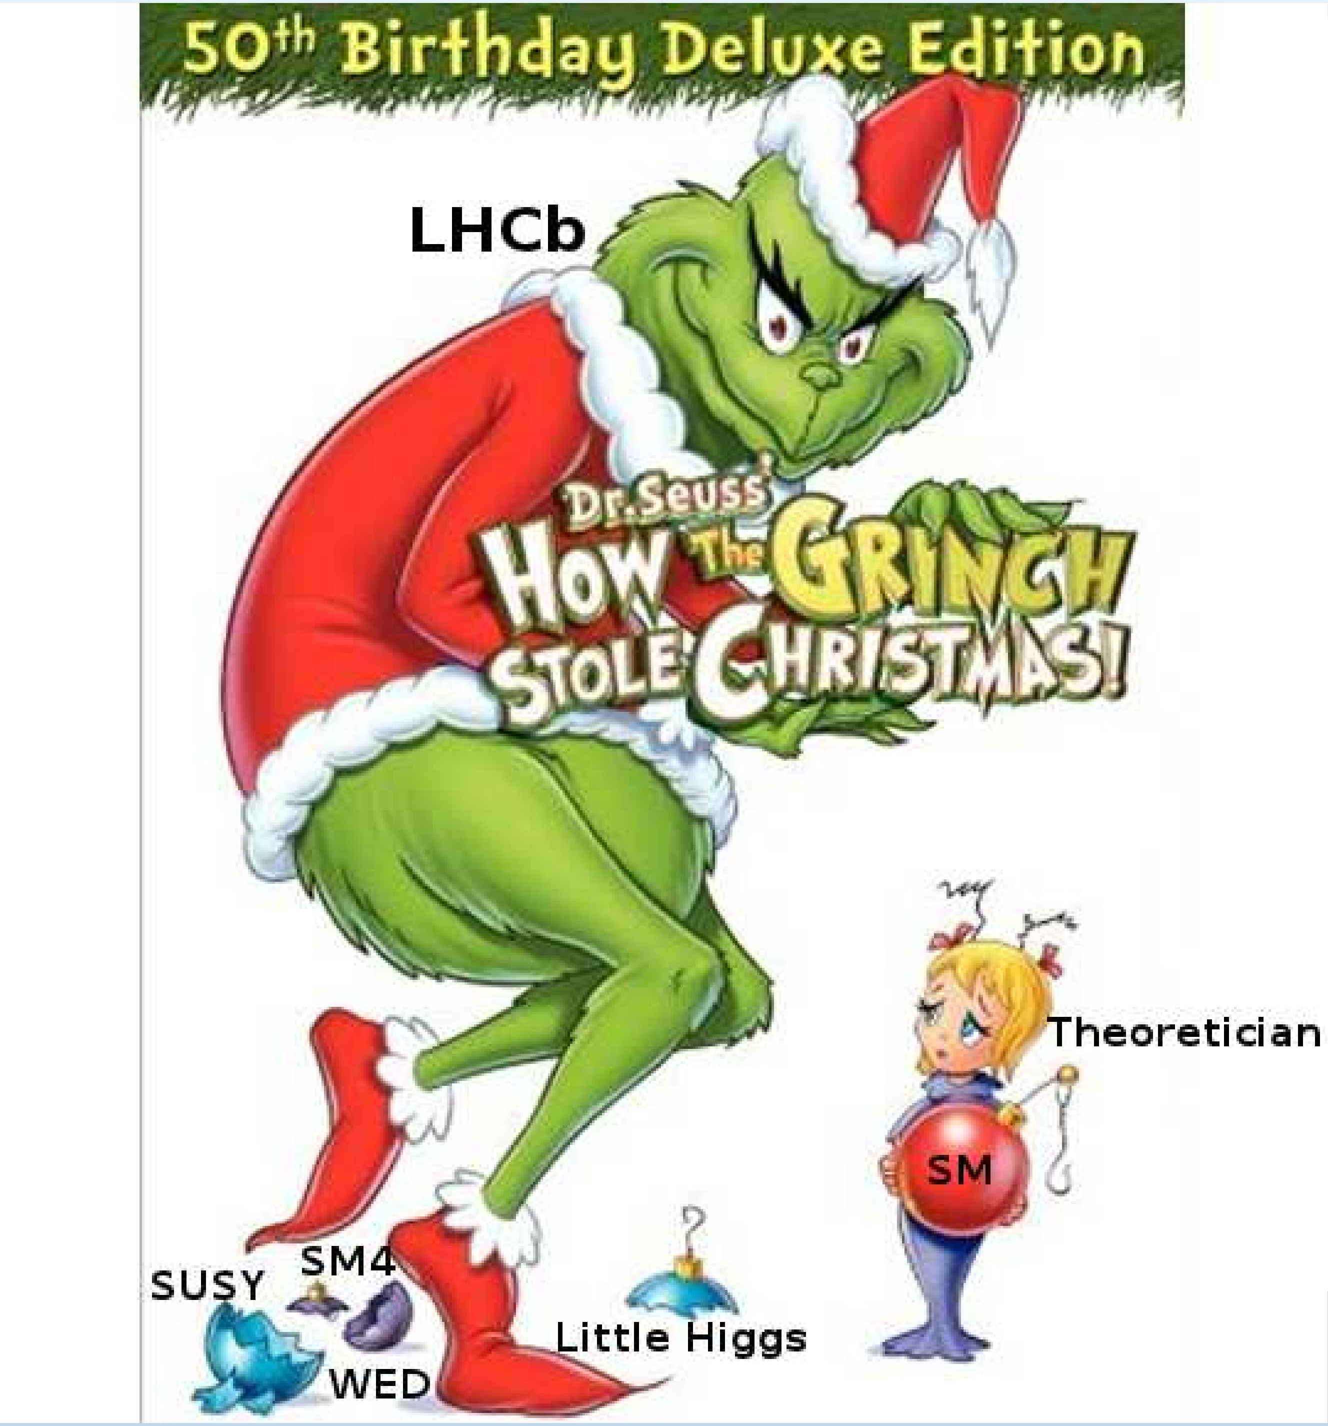
Theoretical update of B-mixing



Alexander Lenz

CERN, Theory Division

TeVatron gave us many presents, and then ...

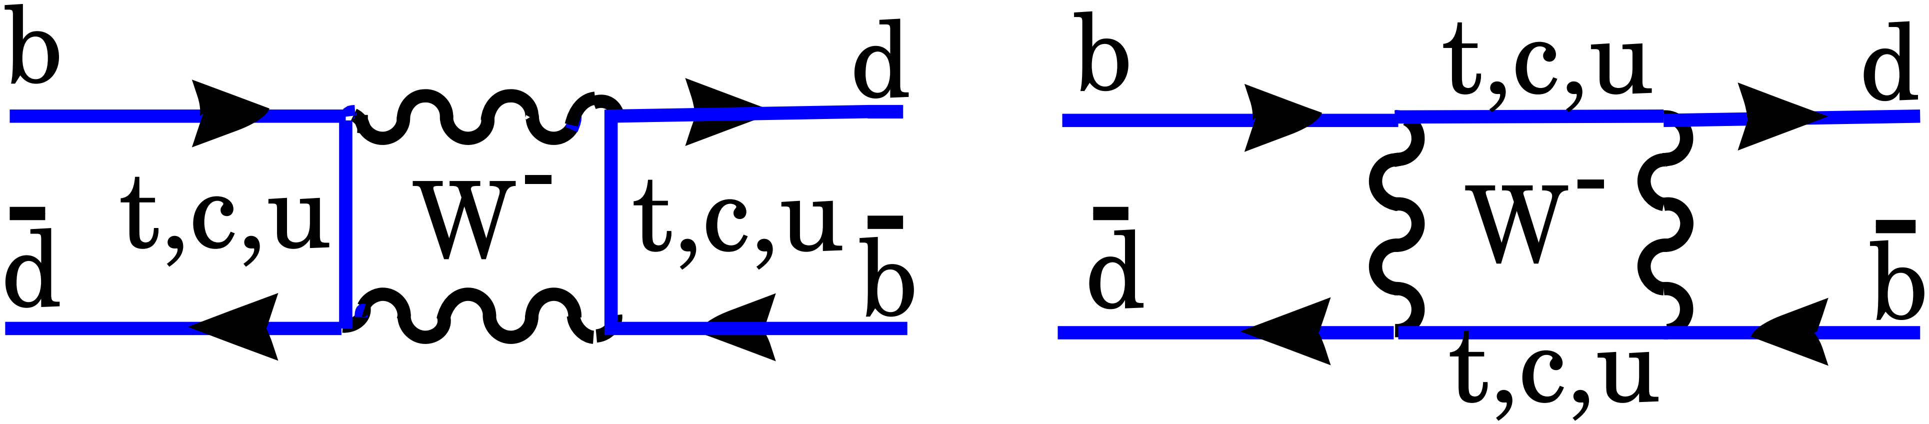


Mixing I

Time evolution of a decaying particle: $B(t) = \exp\left[-i m_B t - \Gamma_B / 2t\right]$
can be written as

$$i \frac{d}{dt} \left(\begin{array}{c} |B(t)\rangle \\ |\bar{B}(t)\rangle \end{array} \right) = \left(\hat{M} - \frac{i}{2} \hat{\Gamma} \right) \left(\begin{array}{c} |B(t)\rangle \\ |\bar{B}(t)\rangle \end{array} \right)$$

BUT: In the neutral B-system transitions like $B_{d,s} \to \bar{B}_{d,s}$ are possible due to weak interaction: **Box diagrams**



Mixing II

Mixing is a macroscopic quantum effect!

It was observed in

- K^0-system: 1950s (see text books, regeneration...)
- B_d-system: 1986
- B_s-system: 2006
- D^0-system: 2007

Strongly suppressed in the SM (due to virtual top-quarks)
New physics effects might be of comparable size

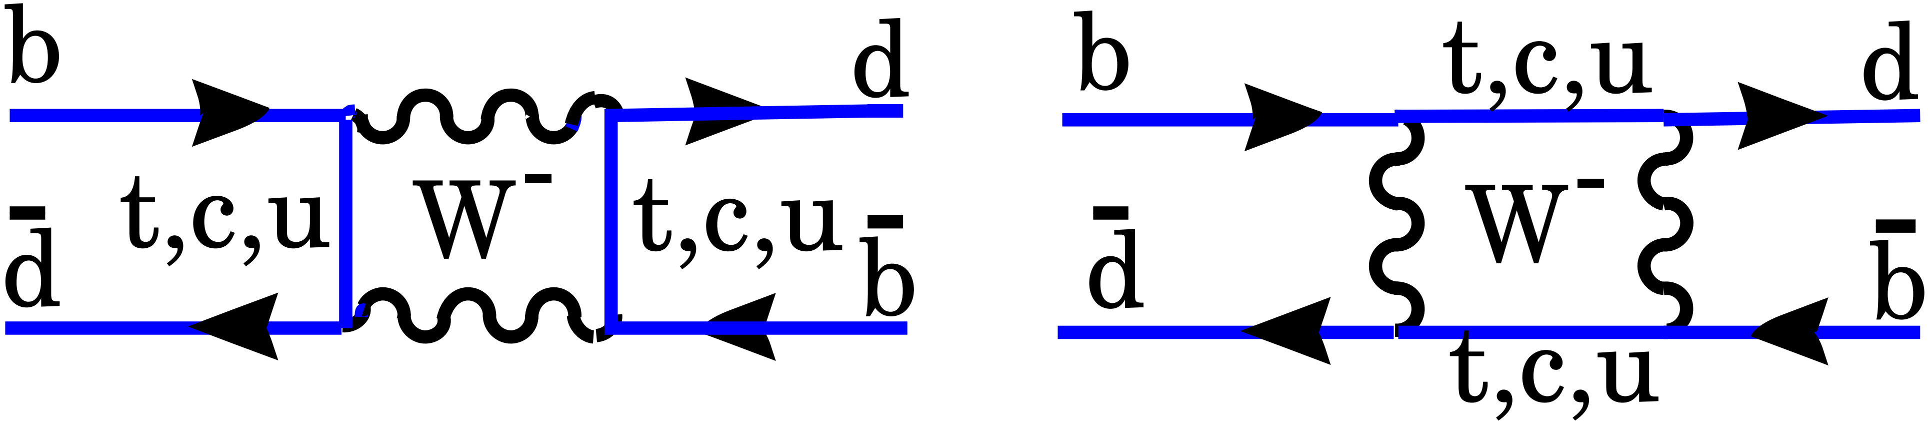
?Is QCD under control?

Mixing III

Time evolution of a decaying particle: $B(t) = \exp\left[-i m_B t - \Gamma_B/2 t\right]$
can be written as

$$i \frac{d}{dt} \left(\begin{array}{c} |B(t)\rangle \\ |\bar{B}(t)\rangle \end{array} \right) = \left(\hat{M} - \frac{i}{2} \hat{\Gamma} \right) \left(\begin{array}{c} |B(t)\rangle \\ |\bar{B}(t)\rangle \end{array} \right)$$

BUT: In the neutral B-system transitions like $B_{d,s} \rightarrow \bar{B}_{d,s}$ are possible due to weak interaction: **Box diagrams**



$\Rightarrow$ **off-diagonal elements** in $\hat{M}$, $\hat{\Gamma}$: M_{12}, Γ_{12} (complex)

Diagonalization of $\hat{M}$, $\hat{\Gamma}$ gives the physical eigenstates B_H and B_L with the masses M_H, M_L and the decay rates Γ_H, Γ_L

CP-odd: $B_H := p\, B + q\, \bar{B}$, CP-even: $B_L := p\, B - q\, \bar{B}$ with $|p|^2 + |q|^2 = 1$

Mixing IV

$|M_{12}|$, $|\Gamma_{12}|$ and $\phi = \text{arg}(-M_{12}/\Gamma_{12})$ can be related to three observables:

- **Mass difference:** $\Delta M := M_H - M_L = 2|M_{12}| \left(1 - \frac{1}{8}\frac{|\Gamma_{12}|^2}{|M_{12}|^2}\sin^2\phi + ...\right)$
  $|M_{12}|$: heavy internal particles: t, SUSY, ...

- **Decay rate difference:** $\Delta\Gamma := \Gamma_L - \Gamma_H = 2|\Gamma_{12}|\cos\phi \left(1 + \frac{1}{8}\frac{|\Gamma_{12}|^2}{|M_{12}|^2}\sin^2\phi + ...\right)$
  $|\Gamma_{12}|$: light internal particles: u, c, ... (almost) no NP!!!

- **Flavor specific/semileptonic CP asymmetries:**
  $\bar{B}_q \to f$ and $B_q \to \bar{f}$ forbidden
  No direct CP violation: $|\langle f|B_q\rangle| = |\langle \bar{f}|\bar{B}_q\rangle|$
  e.g. $B_s \to D_s^-\pi^+$ or $B_q \to Xl\nu$ (*semileptonic*)

$$a_{sl} \quad \equiv \quad a_{fs} = \frac{\Gamma(\overline{B}_q(t) \to f) - \Gamma(B_q(t) \to \overline{f})}{\Gamma(\overline{B}_q(t) \to f) + \Gamma(B_q(t) \to \overline{f})} = -2\left(\left|\frac{q}{p}\right| - 1\right) = \text{Im}\frac{\Gamma_{12}}{M_{12}} = \frac{\Delta\Gamma}{\Delta M}\tan\phi$$

The Mass Difference ΔM

Calculating the box diagram with an internal top-quark yields

$$\boxed{M_{12,q} = \frac{G_F^2}{12\pi^2}(V_{tq}^* V_{tb})^2 M_W^2 S_o(x_t) B_{B_q} f_{B_q}^2 M_{B_q} \hat{\eta}_B}$$

(Inami, Lim ’81)

- Hadronic matrix element: $\frac{8}{3} B_{B_q} f_{B_q}^2 M_{B_q} = \langle \bar{B}_q | (\bar{b}q)_{V-A} (\bar{b}q)_{V-A} | B_q \rangle$
- Perturbative QCD corrections $\hat{\eta}_B$ (Buras, Jamin, Weisz, ’90)

Theory 1102.4274 vs. Experiment : HFAG 11

$\Delta M_d = 0.543 \pm 0.091 \; ps^{-1}$	$\Delta M_d = 0.507 \pm 0.004 \; ps^{-1}$ ALEPH, CDF, D0, DELPHI, L3, OPAL, BABAR, BELLE, ARGUS, CLEO
$\Delta M_s = 17.30 \pm 2.6 \; ps^{-1}$	$\Delta M_s = 17.70 \pm 0.12 \; ps^{-1}$ CDF, D0, LHCb

Important bounds on the unitarity triangle and new physics

Determination of Γ_{12}

Sensitive to real intermediate states $\Rightarrow$ much more complicated than M_{12}

1. OPE I: Integrate out W: like $M_{12} \propto f_B^2 B$
2. OPE II: Heavy quark expansion $\Rightarrow \Gamma_i^{(j)} \propto f_B^2 \sum C_k B_K$

$$\Gamma_{12} = \left(\frac{\Lambda}{m_b}\right)^3 \left(\Gamma_3^{(0)} + \frac{\alpha_s}{4\pi}\Gamma_3^{(1)} + ...\right) + \left(\frac{\Lambda}{m_b}\right)^4 \left(\Gamma_4^{(0)} + ...\right) + \left(\frac{\Lambda}{m_b}\right)^5 \left(\Gamma_5^{(0)} + ...\right) + ...$$

1996: Beneke, Buchalla, Dunietz

1998: Beneke, Buchalla, Greub, A.L., Nierste

2003: Ciuchini, Franco, Lubicz, Mescia, Tarantino; Beneke, Buchalla, A.L., Nierste

2006: A.L., Nierste

2007: Badin, Gabbiani, Petrov

$$\begin{aligned} \Delta\Gamma_s &= \Delta\Gamma_s^0 \left(1 + \delta^{\rm Lattice} + \delta^{\rm QCD} + \delta^{\rm HQE}\right) \\ &= 0.142\ \text{ps}^{-1} \left(1 - 0.14 - 0.06 - 0.19\right) \end{aligned}$$

HQE under attack!

OPE II might be questionable - relies on quark hadron duality

- Mid 90's: Missing Charm puzzle $n_c^{\text{Exp.}} < n_c^{\text{SM}}$, semi leptonic branching ratio
- Mid 90's: Λ_b lifetime is too short
- before 2003: $\tau_{B_s}/\tau_{B_d} \approx 0.94 \neq 1$
- 2010/2011: Di-muon asymmetry too large

Theory arguments for HQE

$\Rightarrow$ calculate corrections in all possible "directions", to test convergence
$\Rightarrow \Gamma_{12}$ seems to be ok!

$\Rightarrow$ test reliability of OPE II via lifetimes (no NP effects expected) "directions", to test convergence
$\Rightarrow \tau(B^+)/\tau(B_d)$ Experiment and theory agree within hadronic uncertainties

HQE under attack!

OPE II might be questionable - relies on quark hadron duality

- 2012: $n_c^{2011\mathrm{PDG}} = 1.20 \pm 0.06$ vs. $n_c^{\mathrm{SM}} = 1.20 \pm 0.04$
  Eberhardt, Krinner, A.L., Rauh in prep.
- Mid 90's: Λ_b lifetime is too short
- before 2003: $\tau_{B_s}/\tau_{B_d} \approx 0.94 \neq 1$
- 2010/2011: Di-muon asymmetry too large

Theory arguments for HQE

⇒ calculate corrections in all possible "directions", to test convergence
$\Rightarrow \Gamma_{12}$ seems to be ok!

⇒ test reliability of OPE II via lifetimes (no NP effects expected) "directions", to test convergence
$\Rightarrow \tau(B^+)/\tau(B_d)$ Experiment and theory agree within hadronic uncertainties

HQE under attack!

OPE II might be questionable - relies on quark hadron duality

- 2012: $n_c^{\rm 2011PDG} = 1.20 \pm 0.06$ vs. $n_c^{\rm SM} = 1.20 \pm 0.04$
  Eberhardt, Krinner, A.L., Rauh in prep.
- HFAG ’03 $\tau_{\Lambda_b} = 1.212 \pm 0.052$ ps^{-1} $\longrightarrow$ HFAG ’11 $\tau_{\Lambda_b} = 1.425 \pm 0.032$ ps^{-1}
  Shift by 4σ $\Rightarrow$Eagerly waiting for new LHCb results!!!
- before 2003: $\tau_{B_s}/\tau_{B_d} \approx 0.94 \neq 1$
- 2010/2011: Di-muon asymmetry too large

Theory arguments for HQE

$\Rightarrow$ calculate corrections in all possible “directions”, to test convergence
$\Rightarrow$ Γ_{12} seems to be ok!

$\Rightarrow$ test reliability of OPE II via lifetimes (no NP effects expected) “directions”, to test convergence
$\Rightarrow$ $\tau(B^+)/\tau(B_d)$ Experiment and theory agree within hadronic uncertainties

HQE under attack!

OPE II might be questionable - relies on quark hadron duality

- 2012: $n_c^{\rm 2011PDG} = 1.20 \pm 0.06$ vs. $n_c^{\rm SM} = 1.20 \pm 0.04$
  Eberhardt, Krinner, A.L., Rauh in prep.
- HFAG '03 $\tau_{\Lambda_b} = 1.212 \pm 0.052$ ps^{-1} $\longrightarrow$ HFAG '11 $\tau_{\Lambda_b} = 1.425 \pm 0.032$ ps^{-1}
  Shift by 4σ ⇒Eagerly waiting for new LHCb results!!!
- **Moriond 2012 LHCb:** $\tau_{B_s}/\tau_{B_d} = 1.001 \pm 0.014$ Talk by Peter Clarke
- 2010/2011: Di-muon asymmetry too large

Theory arguments for HQE

⇒ calculate corrections in all possible "directions", to test convergence
⇒ Γ_{12} seems to be ok!

⇒ test reliability of OPE II via lifetimes (no NP effects expected) "directions", to test convergence
⇒ $\tau(B^+)/\tau(B_d)$ Experiment and theory agree within hadronic uncertainties

The B_s lifetime

Moriond 2012 LHCb vs SM A.L., Nierste 2011

$$\frac{\tau_{B_s}}{\tau_{B_d}}^{\mathrm{Exp}} = 1.001 \pm 0.014 \qquad \frac{\tau_{B_s}}{\tau_{B_d}}^{\mathrm{SM}} = 0.996 ... 1.000$$

- 0.940 ± 0.014 would have been a desaster for SM = may be NP :-)
- Update of effective lifetimes
  Fleischer et al used 1011.1096, 1109.1112, 1109.5115: τ_{B_s} = 1.477 ps

	Exp.	SM-old	SM-new
$\tau^{\mathrm{Eff}}(K^+K^-)$	1.44 ± 0.10	1.390 ± 0.032	1.43 ± 0.03
$\tau^{\mathrm{Eff}}(\psi f_0)$	1.70 ± 0.12	1.582 ± 0.036	1.63 ± 0.03
τ^{FS}	1.417 ± 0.042	$- - -$	1.54 ± 0.03

HQE under attack!

OPE II might be questionable - relies on quark hadron duality

- 2012: $n_c^{\rm 2011PDG} = 1.20 \pm 0.06$ vs. $n_c^{\rm SM} = 1.20 \pm 0.04$
  Eberhardt, Krinner, A.L., Rauh in prep.
- HFAG ’03 $\tau_{\Lambda_b} = 1.212 \pm 0.052$ ps^{-1} $\longrightarrow$ HFAG ’11 $\tau_{\Lambda_b} = 1.425 \pm 0.032$ ps^{-1}
  Shift by 4σ ⇒Eagerly waiting for new LHCb results!!!
- **Moriond 2012 LHCb:** $\tau_{B_s}/\tau_{B_d} = 1.001 \pm 0.014$ Talk by Peter Clarke
- 2010/2011: Di-muon asymmetry too large — Test Γ_{12} with $\Delta\Gamma_s$!

Theory arguments for HQE

⇒ calculate corrections in all possible “directions”, to test convergence
⇒ Γ_{12} seems to be ok!

⇒ test reliability of OPE II via lifetimes (no NP effects expected) “directions”, to test convergence
⇒ $\tau(B^+)/\tau(B_d)$ Experiment and theory agree within hadronic uncertainties

$\Delta\Gamma_s$ in NLO-QCD I

A brief history of theory predictions

$'81$... Hagelin; Buras et al.;...	$\Delta\Gamma \propto \mathcal{O}\left(0.15 \text{ ps}^{-1}\right)$
$'93$ Aleksan et al.; ...	$\Delta\Gamma \propto \mathcal{O}\left(0.10 \text{ ps}^{-1}\right)$
$'96$ Beneke, Buchalla, Dunietz	$\Delta\Gamma_s = \left(0.11^{+0.07}_{-0.06}\right) \text{ ps}^{-1}$
$'00$ Beneke, A.L.	$\Delta\Gamma_s = (0.06 \pm 0.03) \text{ ps}^{-1}$
$'03$ Ciuchini, et al	$\Delta\Gamma_s = (0.050 \pm 0.016) \text{ ps}^{-1}$
$'06$ A.L., Nierste	$\Delta\Gamma_s = (0.096 \pm 0.036) \text{ ps}^{-1}$
$'11$ A.L., Nierste	$\Delta\Gamma_s = (0.087 \pm 0.021) \text{ ps}^{-1}$

Crucial dependence on non-perturbative parameters!

2011 $f_{B_s} = 231 \pm 15$ MeV used.

Newer Results:

- 1110.4510 - HPQCD: $f_{B_s} = 225 \pm 4$ MeV $\Rightarrow \Delta\Gamma_s = (0.083 \pm 0.017) \text{ ps}^{-1}$
- 1112.3051 - Fermilab: $f_{B_s} = 242 \pm 9.5$ MeV $\Rightarrow \Delta\Gamma_s = (0.095 \pm 0.021) \text{ ps}^{-1}$
- 1201.3956 - chiral QM: $f_{B_s} = 262 \pm ?$ MeV $\Rightarrow \Delta\Gamma_s = (0.112 \pm ?) \text{ ps}^{-1}$

$\Delta\Gamma_s$ in NLO-QCD II

Improvement in theoretical accuracy

$\Delta\Gamma_s^{\mathrm{SM}}$	2011	2006
Central Value	$0.087\,\mathrm{ps}^{-1}$	$0.096\,\mathrm{ps}^{-1}$
$\delta(\mathcal{B}_{\widetilde{R}_2})$	17.2%	15.7%
$\delta(f_{B_s})$	13.2%	33.4%
$\delta(\mu)$	7.8%	13.7%
$\delta(\widetilde{\mathcal{B}}_{S,B_s})$	4.8%	3.1%
$\delta(\mathcal{B}_{R_0})$	3.4%	3.0%
$\delta(V_{cb})$	3.4%	4.9%
$\delta(\mathcal{B}_{B_s})$	2.7%	6.6%
...	....	...
$\sum\delta$	24.5%	40.5%

Finally $\Delta\Gamma_s$ is measured! (naive: 6.1σ)

$$\boxed{\Delta\Gamma_s^{\rm SM} \quad = \quad (0.087 \pm 0.021)\,\text{ps}^{-1}}$$

LHCb from $B_s \to J/\psi\phi$

LP 2011 $\Delta\Gamma_s = (0.123 \pm 0.031)\,\text{ps}^{-1} \quad \Rightarrow \quad \frac{\Delta\Gamma_s^{\rm Exp}}{\Delta\Gamma_s^{\rm SM}} = 1.41 \pm 0.50$

Moriond 2012 $\Delta\Gamma_s = (0.116 \pm 0.019)\,\text{ps}^{-1} \quad \Rightarrow \quad \frac{\Delta\Gamma_s^{\rm Exp}}{\Delta\Gamma_s^{\rm SM}} = 1.33 \pm 0.39$

- D0 8fb^{-1} 1109.3166: $\Delta\Gamma_s = (0.163 \pm 0.065)\,\text{ps}^{-1}$
- CDF 9.6fb^{-1}: Talk by G. Borissov $\Delta\Gamma_s < \Delta\Gamma^{\rm SM}$

Finally $\Delta\Gamma_s$ is measured! (naive: 6.1σ)

Get rid off the dependence on f_{B_s} (No NP in ΔM)

$$\begin{aligned} \frac{\Delta\Gamma_s}{\Delta M_s} &= 10^{-4} \cdot \left[46.2 + 10.6 \frac{\tilde{B}'_S}{B} - \left(13.2 \frac{B_{\tilde{R}_2}}{B} - 2.5 \frac{B_{R_0}}{B} + 1.2 \frac{B_R}{B} \right) \right] \\ &= 0.0050 \pm 0.0010 \end{aligned}$$

HQE vs. Experiment

$$\left(\frac{\Delta\Gamma_s}{\Delta M_s} \right)^{\text{Exp}} / \left(\frac{\Delta\Gamma_s}{\Delta M_s} \right)^{\text{SM}} = 1.30 \pm 0.34$$

HQE works also for Γ_{12}!

How precise does it work? 30%? 10%?

Still more accurate data needed! **TeVatron, LHCb, Super-B(elle)**

$\Delta\Gamma_s^{\mathrm{CP}}/\Gamma_s = 2Br(B_s \to D_s^{(*)+} + D_s^{(*)-})$?

- 1993 Aleksan; Le Yaouanc, Olivre, Pene, Raynal:
  The above equation holds in the limit: $m_c \to \infty; m_b - 2m_c \to 0; N_c \to \infty$
  Corresponds to negligible 3-body final state contributions to Γ_{12}^s

$$\frac{\Delta\Gamma_s}{\Gamma_s} \propto \mathcal{O}(0.15)$$

- 1107.4325 Chua, Hou, Shen Reanalysis of the exclusive approach
  - 2-body final states contribute 0.100 ± 0.030 to $\Delta\Gamma/\Gamma$
    Aleksan et al were lucky...
  - 3-body final states contribute about 0.06...0.08
    This is comparable to 2-body final states! $\Rightarrow$ bad approximation $\Rightarrow$ test exp.

We strongly discourage from the inclusion of $Br(Bs \to D^{(*)+} + D^{(*)-})$ *in averages with* $\Delta\Gamma_s$ *determined from clean methods.*

A.L., Nierste; hep-ph/0612167

Semi leptonic CP-asymmetries a_{fs} and $\Delta\Gamma_d$

SM predictions: A.L., U. Nierste, 1102.4274; A.L. 1108.1218

$$\begin{aligned} a_{fs}^s &= (1.9 \pm 0.3) \cdot 10^{-5} & \phi_s &= 0.22^\circ \pm 0.06^\circ \\ a_{fs}^d &= -(4.1 \pm 0.6) \cdot 10^{-4} & \phi_d &= -4.3^\circ \pm 1.4^\circ \\ A_{sl}^b = 0.406 a_{sl}^s &+ 0.594 a_{sl}^d & = &\; (-2.3 \pm 0.4) \cdot 10^{-4} \end{aligned}$$

Experimental bounds

$$\begin{aligned} a_{fs}^s &= (-1150 \pm 610) \cdot 10^{-5} \text{ (HFAG 11)} \\ \phi_s &= -51.6^\circ \pm 12^\circ \quad \text{(A.L., Nierste, CKMfitter, 1008.1593)} \\ &= -0.1^\circ \pm 5.0^\circ \quad \text{LHCb Moriond 2012} \\ a_{fs}^d &= -(49 \pm 38) \cdot 10^{-4} \quad \text{(HFAG 11)} \\ \frac{\Delta\Gamma_d}{\Gamma_d} &= (-17 \pm 21) \cdot 10^{-3} \quad \text{(Belle EPS 2011)} \\ A_{sl}^b &= -(7.87 \pm 1.72 \pm 0.93) \cdot 10^{-3} \text{(D0,1106.6308)} \end{aligned}$$

$A_{sl}^b(Exp.)/A_{sl}^b(Theory) = \mathbf{34}$ $\quad 3.9 - \sigma$**-effect**

New Physics in B-Mixing I

$$\Gamma_{12,s} = \Gamma_{12,s}^{\text{SM}}\,, \qquad M_{12,s} = M_{12,s}^{\text{SM}} \cdot \Delta_s\,; \qquad \Delta_s = |\Delta_s| e^{i\phi_s^\Delta}$$

$$\Delta_s = r_s^2 e^{2i\theta_s} = C_{B_s} e^{2i\phi_{B_s}} = 1 + h_s e^{2i\sigma_s}$$

$$\Delta M_s = 2|M_{12,s}^{\text{SM}}| \cdot |\Delta_s|$$

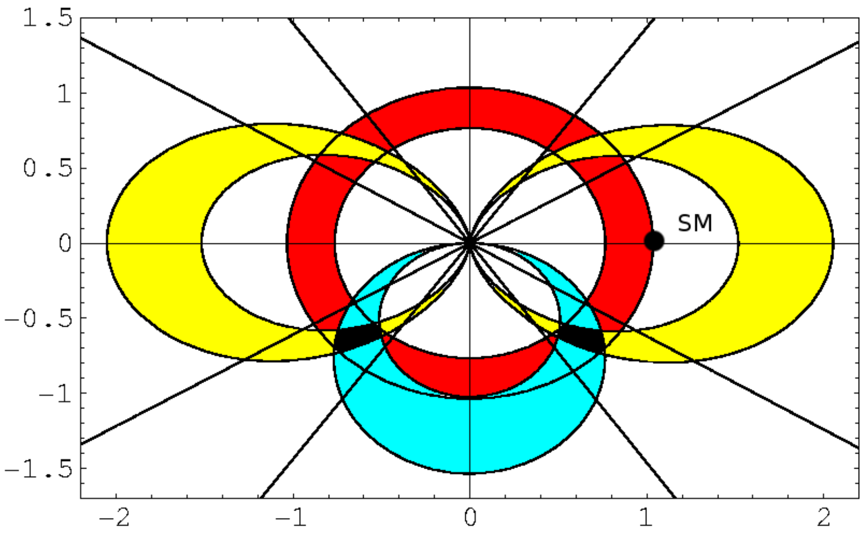
$$\Delta\Gamma_s = 2|\Gamma_{12,s}| \cdot \cos\left(\phi_s^{\text{SM}} + \phi_s^\Delta\right)$$

$$\frac{\Delta\Gamma_s}{\Delta M_s} = \frac{|\Gamma_{12,s}|}{|M_{12,s}^{\text{SM}}|} \cdot \frac{\cos\left(\phi_s^{\text{SM}} + \phi_s^\Delta\right)}{|\Delta_s|}$$

$$a_{fs}^s = \frac{|\Gamma_{12,s}|}{|M_{12,s}^{\text{SM}}|} \cdot \frac{\sin\left(\phi_s^{\text{SM}} + \phi_s^\Delta\right)}{|\Delta_s|}$$

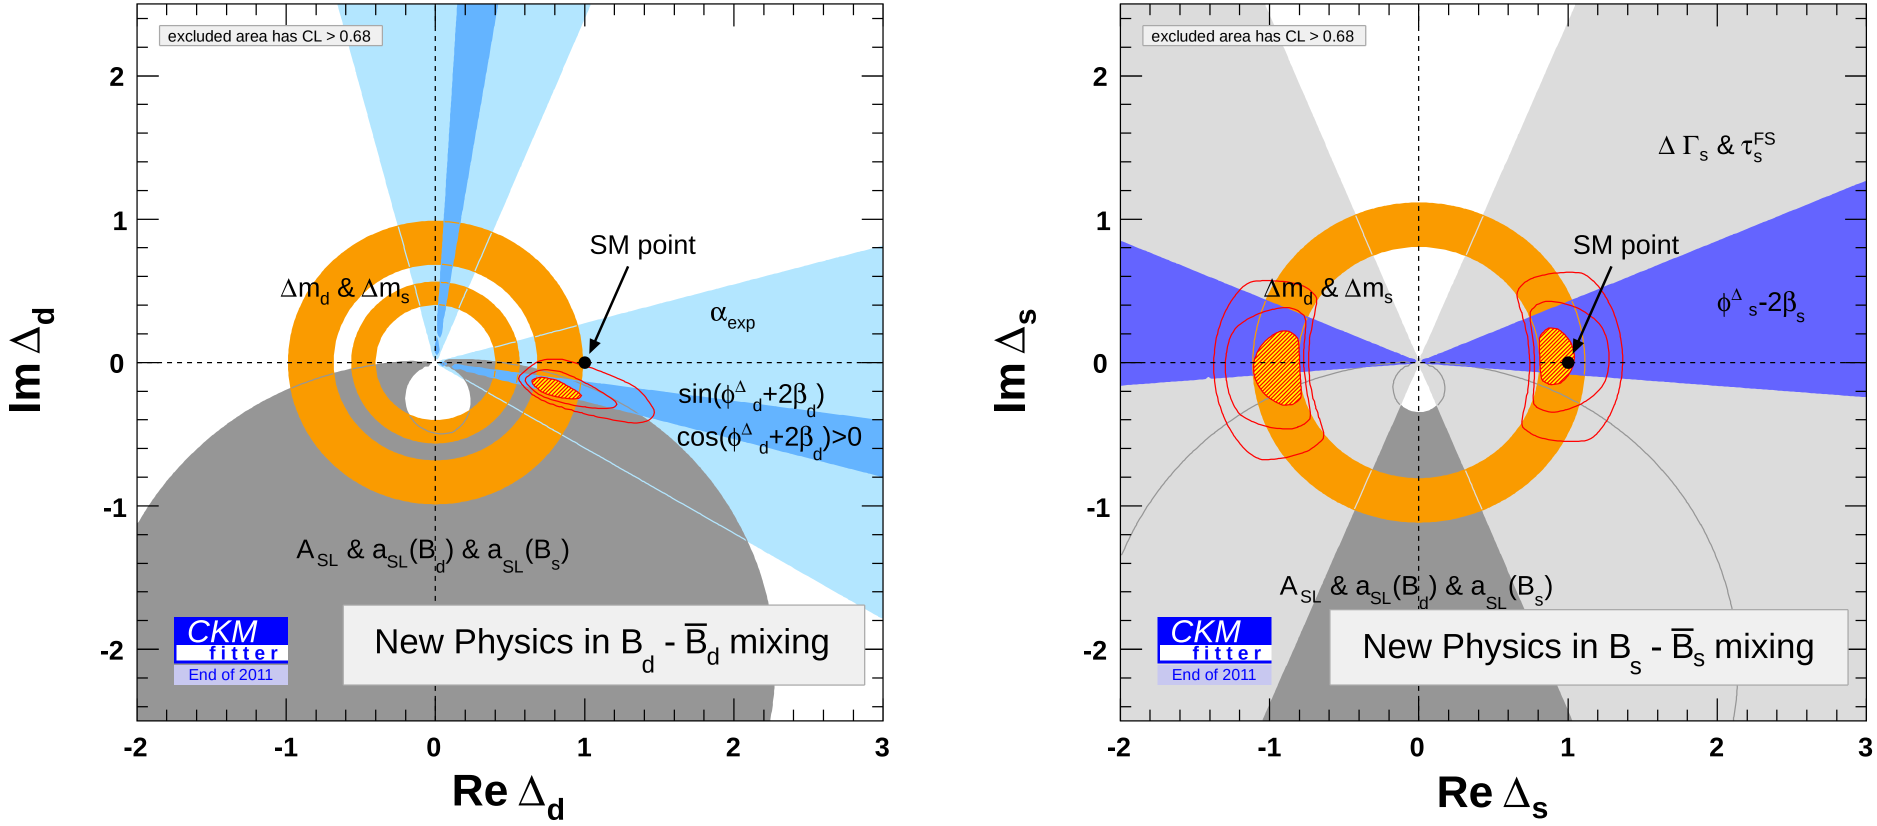
$$\sin(\phi_s^{\text{SM}}) \approx 1/240$$

For $|\Delta_s| = 0.9$ and $\phi_s^\Delta = -\pi/4$ one gets the following bounds in the **complex Δ-plane**:



New Physics in B-Mixing II

Combine all data till end of 2011 and neglect penguins
fit of Δ_d and Δ_s 1203.0238 (update of 1008.1593) soon v2!



- Fits not so good anymore (LHCb vs. Dzero)
- $B \to \tau\nu$ vs. $\sin 2\beta$ solved with ϕ_d^Δ — No tension for ϵ_K

The dimuon asymmetry

The central value of the diμasymmetry is larger than *theoretically* possible!

$$\begin{aligned}
A_{sl}^{Max.} &\approx (0.594 \pm 0.022)(5.4 \pm 1.0) \cdot 10^{-3} \frac{\sin(\phi_d^{SM} + \phi_d^{\Delta})}{|\Delta_d|} \\
&+ (0.406 \pm 0.022)(5.0 \pm 1.1) \cdot 10^{-3} \frac{\sin(\phi_s^{SM} + \phi_s^{\Delta})}{|\Delta_s|} \\
&\approx (-3.1; -4.8[1\sigma]; -9.0[3\sigma]) \cdot 10^{-3} \\
A_{sl}^{D0} &= (-7.8 \pm 2.0) \cdot 10^{-3}
\end{aligned}$$

A.L. 1108.1218

Possible solutions:

- HQE violated by $\mathcal{O}(200\% - 3300\%)$ now excluded!
- Huge new physics in Γ_{12}? - see talk by Uli Haisch
- Contradiction to $B_s \to J/\psi\phi$ from LHCb? - Penguins
- Stat. fluctuation (1.5 σ) of the D0 result? (Actual value is below -4.8 per mille?)
  Independent measurements of semi leptonic asymmetries needed!

?New physics in Γ_{12}?

- Large ($\mathcal{O}(200 - 3400\%)$) NP effects in Γ_{12}?

Why not seen somewhere else?

A new operator $bs \to X$ with $M_x < M_B$ contributes not only to a_{sl}^s but also to many more observables, e.g.:

- 
$$\Gamma_3 \Rightarrow \begin{cases} \tau(B_s)/\tau(B_d) \\ \Delta\Gamma_s \end{cases}$$

- 
$$\Gamma_0 \Rightarrow \begin{cases} \tau(B_x) \\ B_{sl} \\ Br(b \to s \text{ no charm}) \end{cases}$$

- ...
- A promising candidate for X seems to be $\tau^+ + \tau^-$ -> Uli Haisch.

?New physics in Γ_{12}?

- **Missing charm puzzle**, e.g.

Bigi et al '94; Bagan et al. '94; Falk, Wise, Dunietz '95, Neubert '97... A.L. ,hep-ph/0011258

Look at inclusive b-decay into 0, 1, 2 c-quarks

Define $r(x \text{ charm}) := \frac{\Gamma(\text{b}\rightarrow \text{x charm})}{\Gamma_{\text{sl}}}$: $m_b^5 V_{cb}^2$ cancels; Γ_{sl} seems safe

The average number of charm quarks per b-decay reads

$$\begin{aligned} n_c &= 0 + \left[r(1c) + 2r(2c)\right] B_{sl}^{Exp.} \\ &= 1 + \left[r(2c) - r(0c)\right] B_{sl}^{Exp.} \\ &= 2 - \left[r(1c) + 2r(0c)\right] B_{sl}^{Exp.} \end{aligned}$$

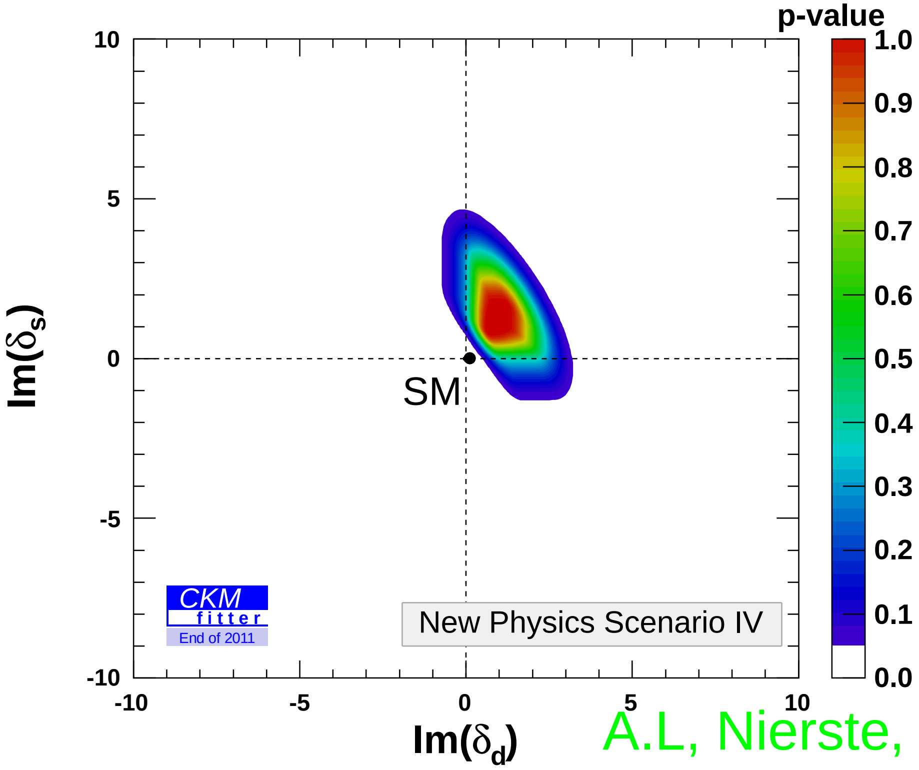
Buchalla, Dunietz, Yamamoto '95

- $n_c^{\text{Exp.}} < n_c^{\text{Theory}}$ = missing charm puzzle
  May be enhanced $b \rightarrow s\ g$... Kagan ...
- latest Data from BaBar and CLEO agree within large uncertainties
  Recent and future experiments can do better!
- Any unknown, even invisible decay mode has an effect on $r(0, 1, 2 \ \text{ charm})$

!!! ⇒ Need new experimental values for $r(0c, 1c, 2c) = \Gamma_{0c,1c,2c}/\Gamma_{sl}$ and B_{sl}!!!

?New physics in Γ_{12}?

Step I: Forget about all the bounds and fit $\Delta\Gamma$, a_{sl} and ΔM:



A.L, Nierste, CKMfitter 1203.0238

Step II: Take your favourite model which gives new contributions to Γ_{12}

- Determine contributions to δ_d, δ_s
- Determine contributions to τ_{B_s}, n_c, ...
- *Exclude the model :-)*

How large are Penguins?

Angular analysis of $B_s \to J/\psi\phi$ at CDF, D0 and LHCb:

$$S_{\psi\phi}^{\rm SM} = 0.0036 \pm 0.002 \to \sin\left(2\beta_s - \phi_s^\Delta - \delta_s^{\rm Peng,SM} - \delta_s^{\rm Peng,NP}\right) = 0.002 \pm 0.087$$

LHCb Moriond 2012

Is this a contraction to the dimuon asymmetry?

Depends on the possible size of penguin contributions

- SM penguin are expected to be very small
  but see also Faller, Fleischer; Mannel 2008
- NP penguins might be larger

But: even small penguin contributions have a sizeable effect! A.L. 1106.3200

Wish-list for Experiments

a) **Congratulations to LHCb for the first measurement of $\Delta\Gamma_s$!**

- Still more precision needed: LHCb, TeVatron, Super-B $B_s \to J/\psi \eta^{(')}$
- Do not use $Br(B_s \to D_s^{(*)+} D_s^{(*)-}) = \frac{\Delta\Gamma^{\rm CP}}{2\Gamma}$ - check size of 3-body FS!

b) $\tau_{B_s} = (1.001 \pm 0.014) \tau_{B_d}$: strong constraint on NP and duality violation

- Combine with other determinations of τ_{B_s}: LHCb, ATLAS?, CMS?
- B_s: Effective lifetimes, flavor specific lifetimes (2.x sigma deviation)
- $\tau_{\Lambda_b}, ...$

c) Di muon asymmetry A_{sl}^b

- HQE fails? **No! At most** $30 - 40\%$ — more precise test via $\tau(B_s), \Delta\Gamma_s, ...$
- NP acts in Γ_{12}? **No! At most** 40%**!** — More precise tests via $\tau(B_s), \Delta\Gamma_s, \Delta\Gamma_d, n_c, B_{sl}, r(0,1,2 \text{ charm}), B_s \to \tau\tau, B \to K\tau\tau, ...$
- ???
- **Experimental cross-check via** a_{sl}^d **and** a_{sl}^s**!**

d) $\phi_s^{LHCb} \ll \phi_s^{A_{sl}^b}$ How large is the penguin pollution?

- Even small penguins can be important!
- **Values** for many penguin modes e.g. $B_s \to J/\psi K_s, K^0 \bar{K}^0, \phi\phi, \eta^{(')}\eta^{(')} ...$

Moriond 2012: Conclusion from B-Mixing

It is actually not bad, what the Grinch left for us

Expansion in $1/m_b$ works so well,

What does this tell about charm? $1/m_c \approx 3 \cdot 1/m_b$

CKM$^-$: How large are Penguins? II

Many observables in the B_s mixing system:

Elimination of $\Gamma_{12}^{\mathrm{Theo}}$ via (No hint for incorrectness of $\Gamma_{12}^{\mathrm{Theo}}$ except: A_{sl}^b is 1.5σ above bound)

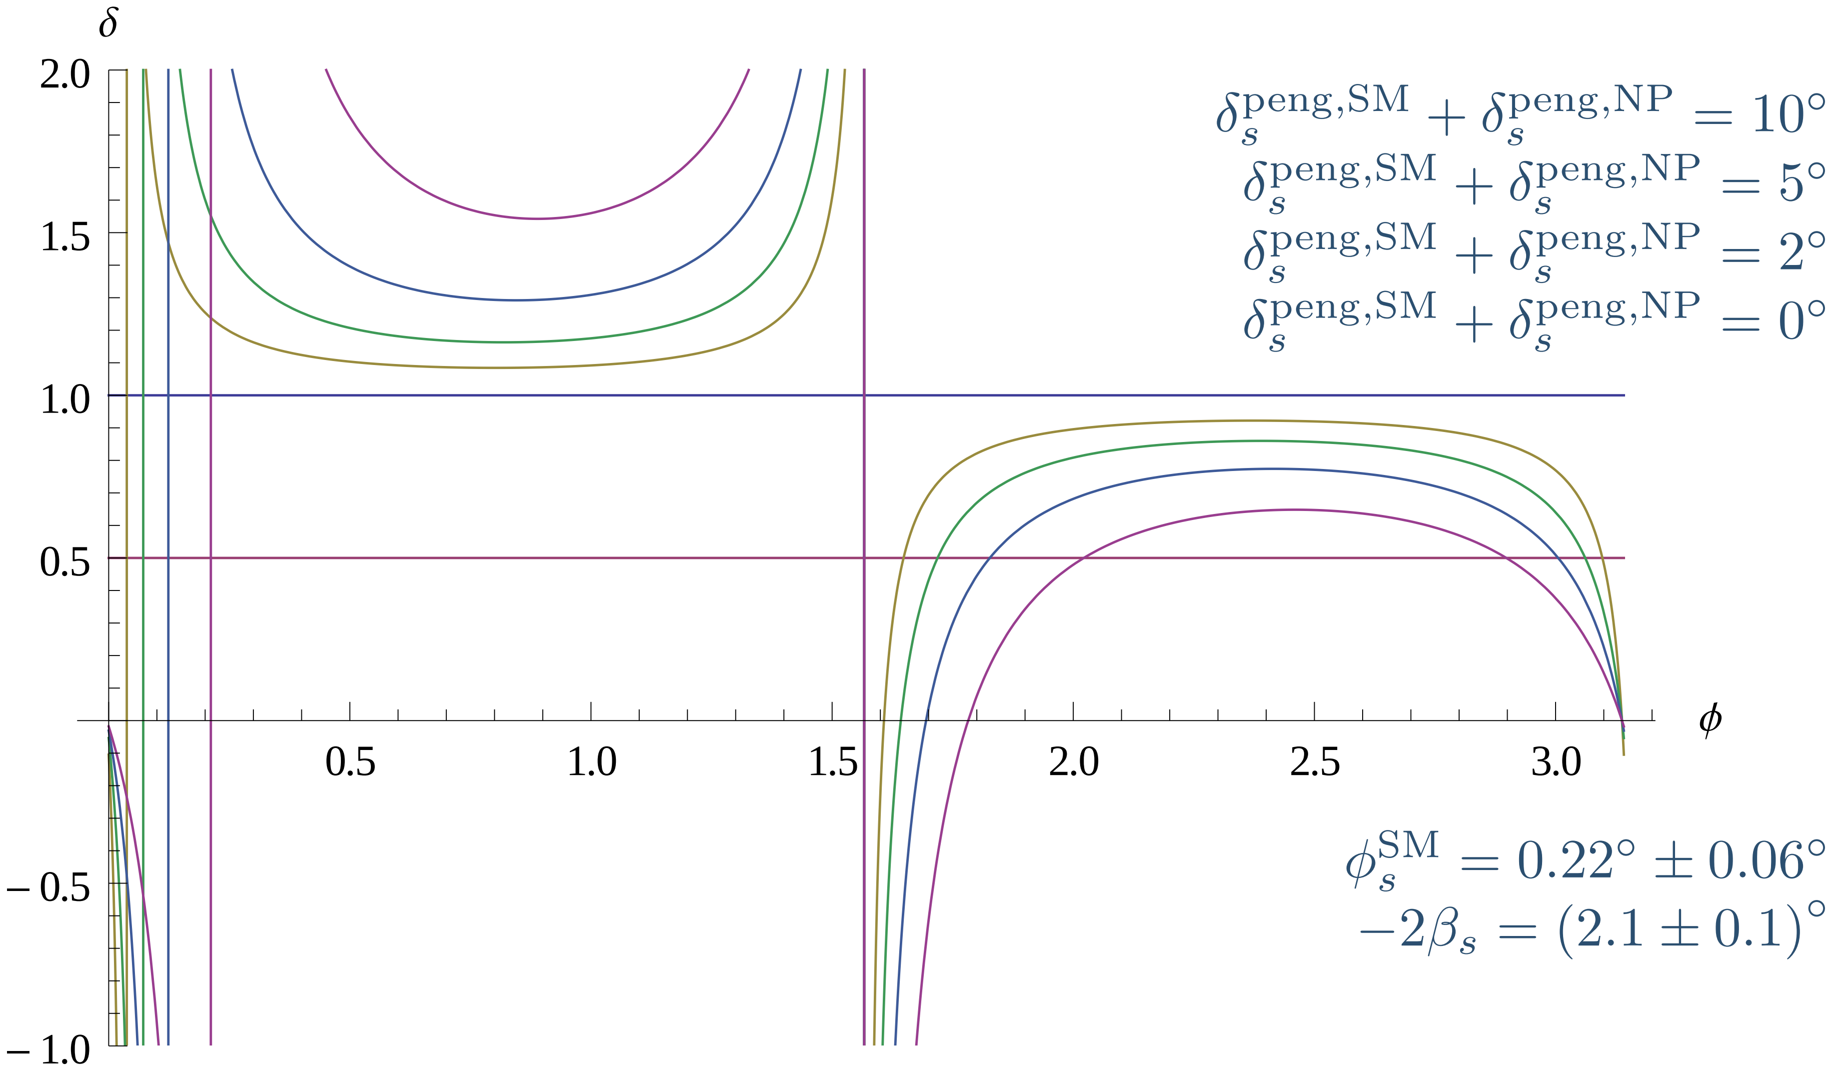
$$\boxed{a_{sl}^s \quad = \quad -\frac{\Delta\Gamma}{\Delta M}\frac{S_{\psi\phi}}{\sqrt{1-S_{\psi\phi^2}}} \cdot \delta}$$

not possible at that simple level, because $\delta \neq 1$

$$\delta \quad = \quad \frac{\tan\left(\phi_s^{\mathrm{SM}} + \phi_s^{\Delta}\right)}{\tan\left(-2\beta_s^{\mathrm{SM}} + \phi_s^{\Delta} + \delta_s^{\mathrm{peng,SM}} + \delta_s^{\mathrm{peng,NP}}\right)}$$

A.L. 1106.3200

CKM$^-$: How large are Penguins? III



$$\delta_s^{\mathrm{peng,SM}} + \delta_s^{\mathrm{peng,NP}} = 10^\circ$$
$$\delta_s^{\mathrm{peng,SM}} + \delta_s^{\mathrm{peng,NP}} = 5^\circ$$
$$\delta_s^{\mathrm{peng,SM}} + \delta_s^{\mathrm{peng,NP}} = 2^\circ$$
$$\delta_s^{\mathrm{peng,SM}} + \delta_s^{\mathrm{peng,NP}} = 0^\circ$$

$$\phi_s^{\mathrm{SM}} = 0.22^\circ \pm 0.06^\circ$$
$$-2\beta_s = (2.1 \pm 0.1)^\circ$$

- Above relation can be used to determine $\delta_s^{\mathrm{peng,SM}} + \delta_s^{\mathrm{peng,NP}}$
- To extract ϕ_s^Δ one needs $\Gamma_{12}^{s,\mathrm{SM}}$

High Energy Physics - Phenomenology

How large can the SM contribution to CP violation in $D^0-\bar D^0$ mixing be?

M. Bobrowski, A. Lenz, J. Riedl, J. Rohrwild

(Submitted on 25 Feb 2010)

We investigate the maximum size of CP violating effects in D-mixing within the Standard Model (SM), using Heavy Quark Expansion (HQE) as theoretical working tool. For this purpose we determine the leading HQE contributions and also α_s corrections as well as subleading $1/m_c$ corrections to the absorptive part of the mixing amplitude of neutral D mesons. It turns out that these contributions to Γ_{12} do not vanish in the exact SU$(3)_\mathrm{F}$ limit. Moreover, while the leading HQE terms give a result for Γ_{12} orders of magnitude lower than the current experimental value, we do find a sizeable phase. In the literature it was suggested that higher order terms in the HQE might be much less affected by the severe GIM cancellations of the leading terms; it is even not excluded that these higher order terms can reproduce the experimental value of y. If such an enhancement is realized in nature, the phase discovered in the leading HQE terms can have a sizeable effect. Therefore, we think that statements like: {\it "CP violating effects in D-mixing of the order of 10^{-3} to 10^{-2} are an unambigous sign of new physics"}--given our limited knowlegde of the SM prediction--are premature. Finally, we give an example of a new physics model that can enhance the leading HQE terms to Γ_{12} by one to two orders of magnitude.
