# Rare B Meson Decays at Tevatron

Walter Hopkins

Cornell University

HCP November 2011

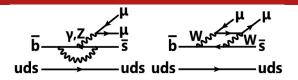

for the CDF Collaboration HCP 2011

$$b \rightarrow s \mu^+ \mu^-$$

$$b o s\mu^+\mu^-$$

CDF, 6.8 fb<sup>-1</sup>, arXiv:1108.0695, Phys. Rev. Lett. 107, 201802 (2011)

#### Motivation

## Theory

- $b \to s \mu^+ \mu^-$  can only occur through higher order FCNC diagrams in Standard Model (SM)
- New Physics Search: Angular Measurements

### Experimental Status

- $B^+ \to \mu^+ \mu^- K^+$ : BaBar, Belle, CDF
- $B^0 \to \mu^+ \mu^- K^*$ : BaBar, Belle (2.7 $\sigma$  deviation for  $A_{FB}$ ), CDF
- $B_s \to \mu^+ \mu^- \phi$ : CDF, DØ
- $B^+ \to \mu^+ \mu^- K^{*+}$ : BaBar, Belle, CDF
- $B^0 o \mu^+ \mu^- K_s$ : BaBar, Belle, CDF
- $\Lambda_b \to \mu^+ \mu^- \Lambda$ : **CDF**

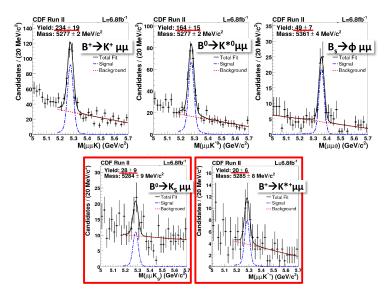

## **Analysis Flow**

- Measure non-resonant modes w.r.t. corresponding resonant modes  $(J/\Psi \rightarrow \mu^+\mu^-)$
- Use dimuon trigger
- Reconstruct  $H_b \to h \mu^+ \mu^-$
- Optimize selection with multivariate discriminant
- Measure B
- Angular measurements

## Signal and Control

Signal Mode	Hadron Decay
$B^+  o \mu^+ \mu^- K^+$	-
$B^0 o \mu^+\mu^-K^{*0}$	$K^{*0}  ightarrow K^+\pi^-$
$B_s  o \mu^+ \mu^- \phi$	$\phi  ightarrow K^+K^-$
$B^+  o \mu^+ \mu^- K^{*+}$	$K^{*+} o K_s\pi^+$
$B^0 o \mu^+\mu^- K_s$	$K_s  ightarrow \pi^+\pi^-$
$\Lambda_b \to \mu^+ \mu^- \Lambda$	$\Lambda  o p \pi^-$

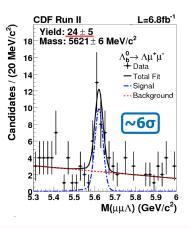

# Meson Decays

First reconstruction at hadron collider

# $\Lambda_b$ Decay

- Theory expectation:  $(4.0 \pm 1.2) \times 10^{-6}$  Phys.Rev.D81, 056006 (2010)
- Rarest  $\Lambda_b$  to date

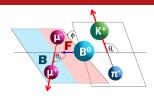

$$\mathcal{B}(\Lambda_b \to \mu^+ \mu^- \Lambda) = (1.73 \pm 0.42 [\text{stat}] \pm 0.55 [\text{syst}]) \times 10^{-6}$$

#### First Observation

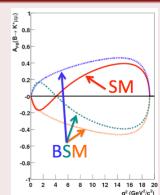

# Angular Observables

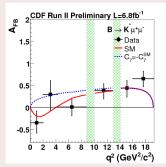

- Sensitive to non-SM physics
- For  $B^0 \to \mu^+ \mu^- K^*$  there are many prediction from several new physics models

• Measure  $A_T^{(2)}$ ,  $A_{Im}$ ,  $A_{FB}$ , and  $F_L$ 

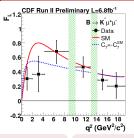

## **Expectations and Observations**

 $A_{FB}(1 < q^2 < 6) = 0.29^{+0.20}_{0.23} \text{ (stat) } \pm 0.07 \text{ (syst)}$ 

# $b \to s \mu^+ \mu^-$ Angular Results

First measurements of right handed currents  $A_T^{(2)}$  and  $A_{in}$ No significant deviation from SM with current statistics

$$B_s \to \mu^- \mu^+$$

$$B_{\rm s} o \mu^- \mu^+$$

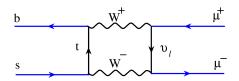

and

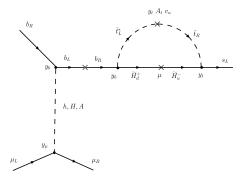

$$B_d \to \mu^- \mu^+$$

CDF, 7 fb<sup>-1</sup>, Phys. Rev. Lett. 107, 191801 (2011)

### Motivation

- $B_s \to \mu^+ \mu^-$  can only occur through higher order FCNC diagrams in Standard Model (SM)
- Suppressed by the GIM Mechanism and helicity
- SM predicts very low rate with little SM background ( $\mathcal{BR}(B_s \to \mu^+\mu^-) = (3.2 \pm 0.2) \times 10^{-9}$ ,  $\mathcal{BR}(B_d \to \mu^+\mu^-) = (1.0 \pm 0.1) \times 10^{-10}$ , E.Gamiz et al. (HPQCD Collaboration), A.J. Buras et al.
- BSM models predict enhancement
- Ratio of  $\mathcal{BR}(B_s \to \mu^+\mu^-)$  and  $\mathcal{BR}(B_d \to \mu^+\mu^-)$  is important to discriminate amongst BSM models
- Clean experimental signature

# **Analysis Description**

#### Simple Analysis

- 2 Muons
- Identify methods of suppressing background and keep signal
- Look for bump in di-muon mass distribution

### Analysis Strategy

- Blind ourselves to di-muon signal mass region
- Use mass sidebands to estimate dominant background in signal region
- Optimize selection criteria a priori
- Build confidence in background estimates by employing same methods on control regions

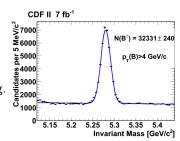

### What do we measure?

$$\mathcal{B}(B_s \to \mu^+ \mu^-) = N_{B_s} \underbrace{\left(\frac{1}{N_{B^+}} \frac{\epsilon_{B^+}^{trig}}{\epsilon_{B_s}^{trig}}\right)}_{N_{B^+}} \underbrace{\left(\frac{\epsilon_{B^+}^{reco}}{\epsilon_{B_s}^{reco}} \frac{\alpha_{B^+}}{\alpha_{B_s}} \frac{1}{\epsilon_{B_s}^{NN}}\right)}_{\left(\frac{f_u}{f_s} \cdot \mathcal{B}(B^+ \to J/\Psi K^+ \to \mu^+ \mu^- K^+)\right)}$$

#### From Data, From MC, From PDG

$$\boxed{ \begin{aligned} N_{B^+} \sim 2 \times 10^4, & \frac{\epsilon^{trig}_{B^+}}{\epsilon^{trig}_{B_s}} \sim 1 \\ \hline \\ \frac{\epsilon^{rec}_{B^+}}{\epsilon^{rec}_{B_s}} \sim 1, & \frac{\alpha_{B^+}}{\alpha_{B_s}} \sim 0.5, & \frac{1}{\epsilon^{NN}_{B_s}} \sim 1 \\ \hline \\ \frac{\epsilon_U}{\epsilon_s} \sim 3, & \mathcal{B}(B^+ \to J/\Psi K^+ \to \mu^+ \mu^- K^+) \sim 5 \times 10^{-5} \end{aligned} }$$

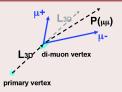

- Measure rate of  $B_s \to \mu^+\mu^-$  relative to  $B^+ \to J/\Psi K^+$ ,  $J/\Psi \to \mu^+\mu^-$
- Apply same selection to find  $B^+ o J/\Psi K^+$
- Systematic uncertainties will cancel in ratio, e.g. dimuon trigger efficiency is the same for both modes

# Signal vs. Background

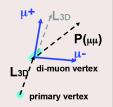

## Signal Properties

- · Final state fully reconstructed
- $B_s$  is long lived ( $c\tau = \sim 450 \mu \text{m}$ )
- B fragmentation is hard: few additional tracks

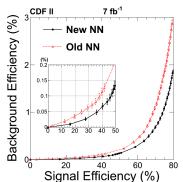

# Background contributions & characteristics

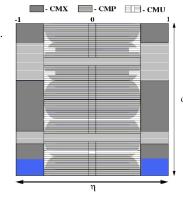

- Sequential semi-leptonic decay:  $b \to c\mu^- X \to \mu^+ \mu^- X$
- Double semi-leptonic decay:  $bb \to \mu^- \mu^+ X$
- Continuum  $\mu^-\mu^+$
- ullet  $\mu$  + fake and fake+fake
  - Partially reconstructed
  - Softer
  - Short lived
  - Has more tracks
- $B \rightarrow hh$ : peaking in signal region

## Analysis Improvements

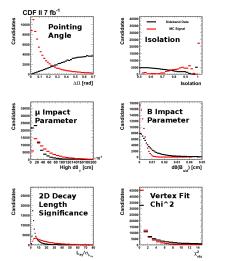

- $\sim$ 50% more data
- 20% Increase in acceptance from CMX miniskirts and COT spacer regions
- New dE/dx calibration for better  $\mu$  ID
- Improved fake rates for peaking background est.
- New NN with 2x better background rejection

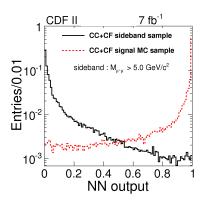

# Signal Discrimination

- 14 Discriminating variables
- Invariant mass of muons with  $2.5\sigma$  window,  $\sigma$ =24 MeV

- Combined in NN, optimized with signal MC and data mass sideband
- Optimize NN a priori with data mass sideband and signal MC
- Validated NN with normalization mode and control region

# **Background Estimates**

## Combinatorial Background

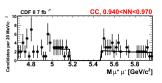

- Fit common slope to all sidebands of NN bins
- Estimate systematics due to shape uncertainty

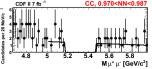

#### Peaking background

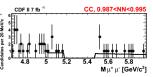

- Only peaking background is  $B \rightarrow hh$
- Estimated using MC and  $D^*$ -tagged  $D^0 o \pi^+ K^-$  data
- Only 10% of combinatorial background in B<sub>s</sub>
- 10x larger in  $B_d$

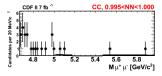

## Background Cross Checks

- Use background enhanced samples to check background procedure
- Good agreement

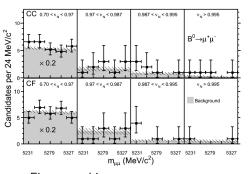

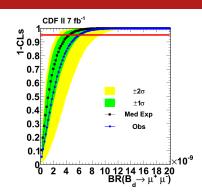

## Results: $B_d$

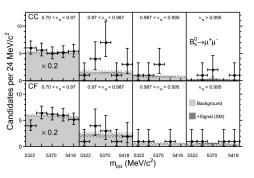

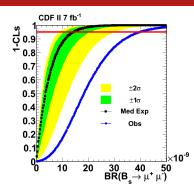

- Five mass bins
- · Five lowest NN bins combined
- Light gray: Background estimates, Hashed: Systematic errors on background
- Error bars on points: Poisson error on mean
- Expected limit:  $\mathcal{B}(B_d \to \mu^+ \mu^-) < 4.6 \times 10^{-9} \ @ 95\% \ C.L.$
- No excess in B<sub>d</sub> mass region (p-value=23%)

 $B_d$  limit:  $\mathcal{B}(B_d \to \mu^+ \mu^-) < 6.0 \times 10^{-9}$  @ 95% C.L.

# Results: Bs

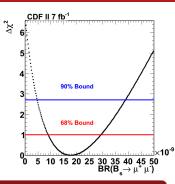

- Dark gray: Expected SM signal
- Expected limit:  $\mathcal{B}(B_s \to \mu^+ \mu^-) < 1.5 \times 10^{-8}$  @ 95% C.L.
- Excess over background-only in central region (the most sensitive)
  - p-value for background only hypothesis: 0.27%
  - p-value for SM+background hypothesis: 1.92%

 $B_s$  limit:  $\mathcal{B}(B_s \to \mu^+\mu^-)$ <4.0  $\times$  10<sup>-8</sup> @ 95% C.L. (> 2 $\sigma$  from expected)

## B<sub>s</sub>: Central Values, Bounds and P-Values

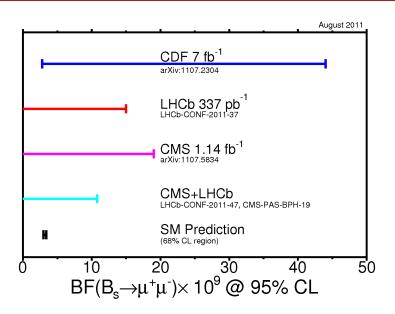

- Includes all systematics
- 90% Bound:  $4.6 \times 10^{-9} < \mathcal{B}(B_s \to \mu^+ \mu^-) < 3.9 \times 10^{-8}$
- Stable: No large deviation when only using subset of bins

### Summary of p-values and limits

	All Bins	2 Highest NN Bins	
Best Fit ( $\times 10^{-8}$ )	$1.8^{+1.1}_{-0.9}$	$1.4^{+1.0}_{-0.8}$	
90% Bounds (×10 <sup>-8</sup> )	$0.46 < \mathcal{B} < 3.9$	$0.33 < \mathcal{B} < 3.3$	
Bkg Only p-value	0.27%	0.66%	
SM+Bkg p-value	1.92%	4.14%	

## Current Experimental Status

# Summary

# $b \rightarrow s \mu^+ \mu^-$

- Updated CDF analysis with more data and analysis improvements
- First observation or  $\Lambda_b \to \mu^+ \mu^- \Lambda$
- First measurement of  $A_T^{(2)}$  and  $A_{im}$
- World's best or comparable results for  $A_{FB}$
- Agreement with SM

# $B_s \to \mu^+ \mu^-$

- CDF updated the  $B_s \to \mu^+\mu^-$  search with doubled dataset (7fb<sup>-1</sup>) and improved analysis technique
- CDF has excess of  $B_s \to \mu^+ \mu^-$  events at the level of  $2.7\sigma$  relative to background only hypothesis
- Set the first two-sided bound on the rate:  $4.6\times10^{-9}<\mathcal{B}(B_s\to\mu^+\mu^-)<3.9\times10^{-8}$  at the 90% CL, compatible with SM and other experiments
- Set upper bound on  $B_d o \mu^+\mu^-$  of  $\mathcal{B}(B_d o \mu^+\mu^-) < 6.0 imes 10^{-9}$
- Update analysis with full CDF dataset is ongoing

## Backup

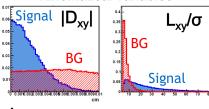

# Backup Slides

#### **Event Selection**

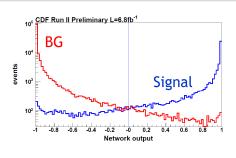

#### Reconstruction

- Online selection: two muons with  $p_T > 1.5$
- Offline: loose preselection + NN (optimized for best sensitivity)
- Remove resonant regions  $(J/\Psi, \Psi')$
- Remove backgrounds such as B→charm and B→charmless by kinematics and muon likelihood cuts.
- Apply acceptance/efficiency corrections

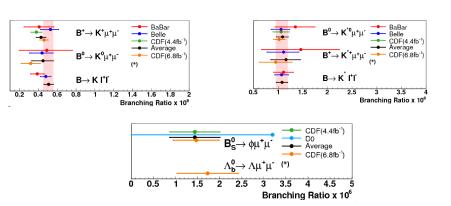

#### Kinematical variables

 $^{\frac{1}{3}}p_T(H_b)$ ,  $p_T(h)$ ,  $p_T(\mu)$ , h mass,  $D_{xy}$ ,  $L_{xy}/\sigma$ , muon likelihood...

# Summary of ${\cal B}$ Measurements

World's most precise  $\mathcal{B}(b \to s \mu^+ \mu^-)$  measurements

# Background Estimate Check

- Check background estimates with background dominated control samples
  - Signal has two opposite sign muons with positive lifetime
  - Control samples have opposite sign negative lifetime, same-sign positive/negative lifetime, and reverse muon ID
  - Total of 64 samples
- Apply same background methods on control sample that we can unblind

Good agreement between observed and expected background

#### Third NN Bin Excess

## Background Estimate Problem

- Combinatorial Background Problem
  - $B_d$  Uses same sideband as  $B_s \Rightarrow \text{No}$  excess in  $B_d$
- Peaking Backgound Problem
  - Only peaking background is  $B \rightarrow hh$
  - 10x larger in B<sub>d</sub> region
  - No excess in  $B_d \Rightarrow \text{good fake rates}$

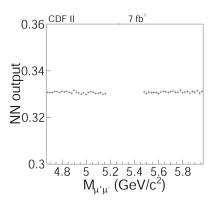

#### Neural Network Problem

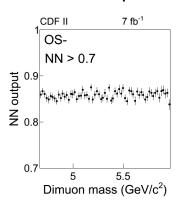

- Mass bias?
- Overtrained?
- Mismodels data?

#### NN Studies: Mass bias

# NN Output vs Dimuon Mass for Signal Sample (blinded)

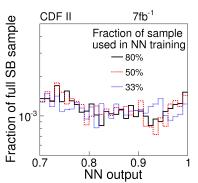

# NN Output vs Dimuon Mass for Control Sample

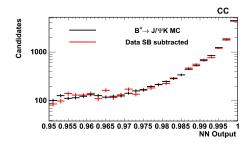

Unlikely to be cause of excess in 3rd NN bin of CC

# NN Studies: Overtraining and Mismodeling

# NN SB background eff for NN's trained on different fractions of SB

# $B^+ o J/\psi K^+$ MC and Data Signal NN Output Distribution

Unlikely to be cause of excess in 3rd NN bin of CC MC models data well

#### Conclusion on 3rd NN bin

- Not due to any NN mismodeling
- · Not due to background mismodeling
- Only explanation left: Not unlikely statistical fluctuation in 80 bins

#### From PRL:

In short, there is no evidence that the excess in this bin is caused by a mistake or systematic error in our background estimates or our modeling of the  $\nu_{NN}$  performance and distribution. The most plausible remaining explanation is that this is a statistical fluctuation.
