

DIRAC Server Installation

DIRAC Project

Overview

- ▶ Requirements
- ▶ Server Installation
- ▶ Post – Installation requirements
- ▶ Accessing the server
- ▶ Installing and monitoring using DIRAC CLI
- ▶ Monitoring inside the server
- ▶ Update the server

Requirements Host

- ▶ 9130-9200 ports should be open in the firewall
- ▶ Ports 80 and 443 should be open and redirected to ports 8080 and 8443
- ▶ Grid services certificates in pem format
- ▶ CAs and CRLs files are updated (/etc/grid-security/certificates)
- ▶ gLite User Interface must be installed and the environment set up.
- ▶ Be sure than the machine is defined in /etc/hosts and hostname returns the FQHN (Fully Qualified Host Name)
 XXX.XXX.XXX.XXX hostname.domain hostname
- ▶ Check than any mysql installation was made previously, remove any my.cnf if this file exist.

Requirements Dirac Directories

- ▶ Create an user account with login *dirac*
`adduser -s /bin/bash -d /home/dirac dirac`
- ▶ Create a directory in /opt called *dirac* belonging to *dirac* user.
`mkdir /opt/dirac`
`chown dirac:dirac /opt/dirac`
- ▶ As *dirac* user, create directories for security data and copy host certificate.
`mkdir -p /opt/dirac/etc/grid-security/`
- ▶ As *dirac* user, create a directory or a link pointing to the CA certificates directory.
`ln -s /etc/grid-security/certificates /opt/dirac/grid-security/certificates`

Requirements Installation files

- ▶ Download `install_site.sh` script and install minimal from:

[https://github.com/DIRACGrid/DIRAC/blob/integration/
Core/scripts/install_site.sh](https://github.com/DIRACGrid/DIRAC/blob/integration/Core/scripts/install_site.sh)

Download `install_minimal.cfg` configuration file:

[https://github.com/DIRACGrid/DIRAC/blob/integration/
Core/scripts/install_minimal.cfg](https://github.com/DIRACGrid/DIRAC/blob/integration/Core/scripts/install_minimal.cfg)

For this tutorial:

http://dirac.in2p3.fr/Tutorial/install_server.cfg

Requirements

Installation File Configuration

- ▶ Note: for tutorial purposes all the WorkloadManagement system is commented out to not to be installed during the first server installation in order to show others procedures of components installation.

Requirements

Installation File Configuration

```
# This section determines which DIRAC components will be installed  
and where
```

LocalInstallation

```
{  
    # DIRAC release version  
    Release = v6r1p4  
    # LCG software package version  
    LcgVer = 2011-06-06  
    # Set this flag to yes if each DIRAC software update will be  
    # installed in a separate directory, not overriding the previous ones  
    UseVersionsDir = yes  
    # The directory of the DIRAC software installation  
    TargetPath = /vo/dirac  
    # DIRAC extensions to be installed  
    ExtraModules = Web  
    PythonVersion = 26}
```

Requirements

Installation File Configuration

```
# Site name
SiteName = LCG.IN2P3.fr

# Setup name
Setup = Dirac-Production

# Default name of system instances
InstanceName = Production

# Flag to skip CA checks when talking to services
SkipCAChecks = no

# Flag to skip CA download (if they are already available
at the server)
SkipCADownload = yes

# Flag to use the server certificates
UseServerCertificate = yes

# Configuration Server URL
ConfigurationServer = dips://ccegeevml01.in2p3.fr:9135/
Configuration/Server
```

Requirements

Installation File Configuration

```
# Used when build the URL to be published for the
installed service (default: socket.getfqdn())
Host = ccegeevmli01.in2p3.fr
# The list of DIRAC Systems to be installed
Systems = Configuration
Systems += Framework
Systems += DataManagement
Systems += WorkloadManagement
Systems += Accounting
Systems += RequestManagement
# The list of Services to be installed
Services = Configuration/Server
Services += Framework/SystemAdministrator
Services += DataManagement/StorageElement
Services += DataManagement/FileCatalog
Services += DataManagement/StorageElementProxy
```

Requirements

Installation File Configuration

```
Services += Framework/SystemLoggingReport
Services += Framework/Monitoring
Services += Framework/Notification
Services += Framework/SecurityLogging
Services += Framework/UserProfileManager
Services += Framework/ProxyManager
Services += Framework/SystemLogging
Services += Framework/Plotting
Services += Framework/BundleDelivery
#Services += WorkloadManagement/SandboxStore
#Services += WorkloadManagement/Matcher
#Services += WorkloadManagement/JobMonitoring
#Services += WorkloadManagement/JobManager
#Services += WorkloadManagement/JobStateUpdate
#Services += WorkloadManagement/WMSAdministrator
#Services += RequestManagement/RequestManager
#Services += Accounting/DataStore
#Services += Accounting/ReportGenerator
```

Requirements

Installation File Configuration

```
## The list of Agents to be installed
Agents = Framework/SystemLoggingDBCleaner
Agents += Framework/CAUpdateAgent
Agents += Framework/TopErrorMessagesReporter
#Agents += WorkloadManagement/MightyOptimizer
#Agents += WorkloadManagement/PilotStatusAgent
#Agents += WorkloadManagement/JobHistoryAgent
#Agents += WorkloadManagement/SiteDirector
#Agents += WorkloadManagement/InputDataAgent
#Agents += WorkloadManagement/TaskQueueDirector
#Agents += WorkloadManagement/JobCleaningAgent
#Agents += WorkloadManagement/StalledJobAgent
Agents += Configuration/CE2CSAgent
# Flag determining whether the Web Portal will be installed
WebPortal = yes
```

Requirements

Installation File Configuration

```
# Flag to set up the Configuration Server as Master
ConfigurationMaster = yes
# Configuration Name
ConfigurationName = Dirac-Prod

# Name of the Admin user (default: None )
AdminUserName = vhamar
# DN of the Admin user certificate (default: None )
AdminUserDN = /O=GRID-FR/C=FR/O=CNRS/OU=CPPM/CN=Vanessa
Hamar
# Email of the Admin user (default: None )
AdminUserEmail = hamar@cppm.in2p3.fr
# Name of the Admin group (default: dirac_admin )
AdminGroupName = dirac_admin
```

Requirements

Installation File Configuration

```
# DN of the host certificate (default: None )
HostDN = /O=GRID-FR/C=FR/O=CNRS/OU=CC-IN2P3/CN=dirac.in2p3.fr
Databases = AccountingDB
Databases += SandboxMetadataDB
#Databases += JobDB
Databases += FileCatalogDB
#Databases += JobLoggingDB
Databases += UserProfileDB
#Databases += TaskQueueDB
Databases += NotificationDB
Databases += RequestDB
Databases += ComponentMonitoringDB
Databases += ProxyDB
Databases += PilotAgentsDB
Databases += SystemLoggingDB
}
```

Server Installation

- ▶ Execute the installation script using the configuration file as option
- ▶ `./install_site.sh install_server.cfg`

- ▶ At the end of the installation must appear something like:

Name	:	Runit	Uptime	PID
Configuration_Server	:	Run	667	8748
DataManagement_FileCatalog	:	Run	252	9408
Framework_CAUpdateAgent	:	Run	62	9934

Server Installation

Name	:	Runit	Uptime	PID
Configuration_Server	:	Run	667	8748
DataManagement_FileCatalog	:	Run	252	9408
Framework_CAUpdateAgent	:	Run	62	9934
Framework_SecurityLogging	:	Run	176	9635
Framework_SystemAdministrator	:	Run	285	9322
DataManagement_StorageElementProxy	:	Run	236	9452
DataManagement_StorageElement	:	Run	268	9365
Framework_Monitoring	:	Run	208	9544
Framework_SystemLoggingDBCleaner	:	Run	78	9885
Framework_UserProfileManager	:	Run	160	9681
Framework_SystemLogging	:	Run	127	9766
Framework_ProxyManager	:	Run	144	9726
Framework_TopErrorMessagesReporter	:	Run	45	10010
	Web_paster	:	Run	6
Configuration_CE2CSAgent	:	Run	7	10827
	Web_httpd	:	Run	7
Framework_Plotting	:	Run	110	9809
Framework_Notification	:	Run	192	9591
Framework_SystemLoggingReport	:	Run	220	9497
Framework_BundleDelivery	:	Run	94	9841

Post – Installation Requirement

- ▶ To start the service automatically each time the server is restarted it is possible to add the next line at the end of /etc/inittab file:

```
SV:123456:respawn:/opt/dirac/sbin/runsvdir-start
```

- ▶ This script contains the following lines:

```
#!/bin/bash
source /opt/dirac/bashrc
RUNSVCTRL=`which runsvctrl`
chpst -u dirac $RUNSVCTRL d /opt/dirac/startup/*
killall runsv svlogd
killall runsvctrl
/opt/dirac/pro/mysql/share/mysql/mysql.server stop --user=dirac
sleep 10
/opt/dirac/pro/mysql/share/mysql/mysql.server start --user=dirac
sleep 20
RUNSVDIR=`which runsvdir`
exec chpst -u dirac $RUNSVDIR -P /opt/dirac/startup 'log: DIRAC runsv'
```

Accessing the Server

- ▶ As `dirac_admin` user you can login from a remote DIRAC client using:

```
dirac-admin-sysconfig-cli --host <server_name>
```

- ▶ This command allows you to execute various commands, check the status, restart services, install components.
- ▶ In this case the possibilities are:
 - ▶ Use cccli/AFS DIRAC client defining your own configuration file.
 - ▶ Install a DIRAC client in your virtual machine.

Accessing the Server

- ▶ Using cccli/AFS DIRAC client:
 - ▶ Create a .dirac.cfg in your home

```
DIRAC
{
    VirtualOrganization = vo.formation.idgrilles.fr
    Setup = Dirac-Production
    Configuration
    {
        Servers = dips://ccegeevml101.in2p3.fr:9135/Configuration/Server
    }
    Security
    {
        UseServerCertificate = no
        SkipCACheck = yes
    }
}
```

Accessing the Server

▶ Installing a DIRAC client in your virtual machine:

Create a local user, copy your certificate in .globus

```
$ wget -np  
https://raw.github.com/DIRACGrid/DIRAC/integration/  
Core/scripts/dirac-install.py  
$ chmod 755 dirac-install.py  
$ ./dirac-install.py -g 2011-06-06 -r v6r1p2  
$ source bashrc  
$ dirac-proxy-init  
$ dirac-configure -V vo.formation.idgrilles.fr -S  
Dirac-Production -C dips://ccegeevml01.in2p3.fr:  
9135/Configuration/Server
```

Accessing the Server

- ▶ Create your proxy as `dirac_admin`

```
$ dirac-proxy-init -g dirac_admin
```

- ▶ Check that your proxy has the extension:

DIRAC group : `dirac_admin`

- ▶ Start the admin console

```
$ dirac-admin-sysadmin-cli --host <HOST_NAME>
```

Accessing the Server

▶ Getting help

> `help`

Documented commands (type help <topic>):

```
=====
add   execfile  install  restart  show   stop
exec  exit      quit     set      start  update
```

Undocumented commands:

```
=====
help
```

▶ Getting help for a special command

> `help install`

Install various DIRAC components

usage:

```
install mysql
install db <database>
install service <system> <service>
install agent <system> <agent>
```

Accessing the Server

▶ Showing available Services and Agents

> `show software`

```
{'Agents': {'Configuration': ['CE2CSAgent', 'UsersAndGroups'],
             'DataManagement': ['TransferAgent',
                                'ReplicationScheduler',
                                'RemovalAgent',
                                'FTSMonitorAgent',
                                'FTSCleaningAgent',
                                'RegistrationAgent',
                                'FTSSubmitAgent',
                                'SEvsLFCAgent',
                                'LFCvsSEAgent'],
             'Framework': ['LemonAgent',
                           'MyProxyRenewalAgent',
                           'TopErrorMessagesReporter',
                           'SystemLoggingDBCleaner',
                           'ErrorMessageMonitor',
                           'CAUpdateAgent']},
```

Installing and monitoring using DIRAC CLI

- ▶ Before starting the installation of other components it is necessary to be sure that the databases associated are installed.

- ▶ The order recommended to make the installation is:
 1. Instances
 2. Databases
 3. Services
 4. Agents

Installing and monitoring using DIRAC CLI

▶ Add an instance:

```
> add instance Accounting Production
```

Adding Accounting system as Production instance
for Dirac-Production setup to dirac.cfg and CS

Accounting system instance Production added
successfully

▶ Installing databases

```
> install db JobDB
```

MySQL root password:

Adding to CS WorkloadManagement/JobDB

Database JobDB from DIRAC/

WorkloadManagementSystem installed successfully

Installing and monitoring using DIRAC CLI

▶ Show databases status:

> **show databases**

```
DataLoggingDB : Not installed
SandboxMetadataDB : Installed
JobDB : Installed
FileCatalogDB : Installed
TransformationDB : Not installed
JobLoggingDB : Installed
UserProfileDB : Installed
ResourceManagementDB : Not installed
TaskQueueDB : Not installed
.....
```

```
NotificationDB : Installed
RequestDB : Installed
ComponentMonitoringDB : Installed
StorageManagementDB : Not installed
DataIntegrityDB : Not installed
ProxyDB : Installed
AccountingDB : Installed
PilotAgentsDB : Installed
ResourceStatusDB : Not installed
TransferDB : Not installed
SystemLoggingDB : Installed
```

Installing and monitoring using DIRAC CLI

- ▶ Show installed software

> **show installed**

```
{'Agents': {'Configuration': ['CE2CSAgent'],
  'Framework': ['TopErrorMessagesReporter',
    'CAUpdateAgent',
    'SystemLoggingDBCleaner']}},
{'Services': {'Configuration': ['Server'],
  'DataManagement': ['StorageElement',
    'FileCatalog',
    'StorageElementProxy']},
```

```
'Framework': ['SecurityLogging',
  'ProxyManager',
  'UserProfileManager',
  'Plotting',
  'SystemLogging',
  'SystemAdministrator',
  'Notification',
  'BundleDelivery',
  'SystemLoggingReport',
  'Monitoring']}}
```

Installing and monitoring using DIRAC CLI

▶ Installing services

```
> install service WorkloadManagement SandboxStore
```

```
Loading configuration template /home/hamar/DIRAC-  
v6r1p2/DIRAC/WorkloadManagementSystem/  
ConfigTemplate.cfg
```

```
Adding to CS WorkloadManagement/SandboxStore  
service WorkloadManagement_SandboxStore is  
installed, runit status: Run
```

Installing and monitoring using DIRAC CLI

> show status

System	Name	Type	Setup	Installed	Runit	Uptime	PID
<hr/>							
DataManagement	StorageElement	service	SetUp	Installed	Run	2610	9365
DataManagement	FileCatalog	service	SetUp	Installed	Run	2594	9408
DataManagement	StorageElementProxy	service	SetUp	Installed	Run	2578	9452
Framework	SystemLoggingReport	service	SetUp	Installed	Run	2562	9497
Framework	Monitoring	service	SetUp	Installed	Run	2550	9544
Framework	Notification	service	SetUp	Installed	Run	2534	9591
Framework	SecurityLogging	service	SetUp	Installed	Run	2518	9635

Framework	CAUpdateAgent	agent	SetUp	Installed	Run	2404	9934
Framework	TopErrorMessagesReporter	agent	SetUp	Installed	Run	2387	10010
Configuration	CE2CSAgent	agent	SetUp	Installed	Run	1	2345

Installing and monitoring using DIRAC CLI

▶ Installing agents

```
> install agent WorkloadManagement  
    MightyOptimizer
```

```
Loading configuration template /home/hamar/DIRAC-  
v6r1p2/DIRAC/WorkloadManagementSystem/  
ConfigTemplate.cfg
```

```
Adding to CS WorkloadManagement/MightyOptimizer  
agent WorkloadManagement_MightyOptimizer is  
installed, runit status: Run
```

Installing and monitoring using DIRAC CLI

> show status

System	Name	Type	Setup	Installed	Runit	Uptime	PID
DataManagement	StorageElement	service	setUp	Installed	Run	2763	9365
DataManagement	FileCatalog	service	setUp	Installed	Run	2747	9408
DataManagement	StorageElementProxy	service	setUp	Installed	Run	2731	9452
Framework	SystemLoggingReport	service	setUp	Installed	Run	2715	9497
Framework	Monitoring	service	setUp	Installed	Run	2703	9544
Framework	Notification	service	setUp	Installed	Run	2687	9591
Framework	SecurityLogging	service	setUp	Installed	Run	2671	9635
Framework	UserProfileManager	service	setUp	Installed	Run	2655	9681
Framework	ProxyManager	service	setUp	Installed	Run	2639	9726
Framework	SystemAdministrator	service	setUp	Installed	Run	2780	9322
Framework	SystemLogging	service	setUp	Installed	Run	2622	9766
Framework	Plotting	service	setUp	Installed	Run	2605	9809
Framework	BundleDelivery	service	setUp	Installed	Run	2589	9841
WorkloadManagement	SandboxStore	service	setUp	Installed	Run	198	1888
Configuration	Server	service	setUp	Installed	Run	3162	8748
Framework	SystemLoggingDBCleaner	agent	setUp	Installed	Run	2573	9885
Framework	CAUpdateAgent	agent	setUp	Installed	Run	2557	9934
Framework	TopErrorMessagesReporter	agent	setUp	Installed	Run	2540	10010
WorkloadManagement 3491	MightyOptimizer	agent	setUp	Installed	Run		41
Configuration	CE2CSAgent	agent	setUp	Installed	Run	1	3921

Installing and monitoring using DIRAC CLI

▶ Checking the logs

```
> show log WorkloadManagement SandboxStore
    /vo/dirac/versions/v6r1p4_1326728294/Linux_x86_64_glibc-2.5/lib/python2.6/site-packages/

```

Installing and monitoring using DIRAC CLI

- ▶ If the installation requires the installation of more than one service, or a group of components with DIRAC a file with dirac cli commands can be created and executed from Admin CLI.

Installing and monitoring using DIRAC CLI

- ▶ Download the file with DIRAC commands from:

<http://dirac.in2p3.fr/Tutorial/FileToExecute.txt>

```
$ more FileToExecute.txt
install db TaskQueueDB
install service WorkloadManagement SandboxStore
install service WorkloadManagement Matcher
install service WorkloadManagement JobMonitoring
install service WorkloadManagement JobManager
install service WorkloadManagement JobStateUpdate
install service WorkloadManagement WMSAdministrator
install service RequestManagement RequestManager
install service Accounting DataStore
install service Accounting ReportGenerator
install agent WorkloadManagement MightyOptimizer
install agent WorkloadManagement PilotStatusAgent
install agent WorkloadManagement JobHistoryAgent
install agent WorkloadManagement SiteDirector
install agent WorkloadManagement InputDataAgent
install agent WorkloadManagement TaskQueueDirector
install agent WorkloadManagement JobCleaningAgent
install agent WorkloadManagement StalledJobAgent
```

Installing and monitoring using DIRAC CLI

▶ Installing from a text file using Admin CLI:

```
> execfile FileToExecute.txt
--> Executing install db TaskQueueDB
MySQL root password:
Adding to CS WorkloadManagement/TaskQueueDB
Database TaskQueueDB from DIRAC/WorkloadManagementSystem installed successfully
--> Executing install service WorkloadManagement SandboxStore
service WorkloadManagement_SandboxStore is installed, runit status: Run
--> Executing install service WorkloadManagement Matcher
Loading configuration template /home/hamar/DIRAC-v6r1p2/DIRAC/WorkloadManagementSystem/
ConfigTemplate.cfg
Adding to CS WorkloadManagement/Matcher
service WorkloadManagement_Matcher is installed, runit status: Run
...
--> Executing install agent WorkloadManagement StalledJobAgent
Loading configuration template /home/hamar/DIRAC-v6r1p2/DIRAC/WorkloadManagementSystem/
ConfigTemplate.cfg
Adding to CS WorkloadManagement/StalledJobAgent
agent WorkloadManagement_StalledJobAgent is installed, runit status: Run
```

Installing and monitoring using DIRAC CLI

- ▶ Checking a complete installation

> **show status**

20 WorkloadManagement	SandboxStore	0	0	

Installing and monitoring using DIRAC CLI

▶ Restarting services:

> **help restart**

Restart services or agents or database server
usage:

restart <system|*> <service|agent|*>

restart mysql

Example:

> **restart WorkloadManagement SiteDirector**

Monitoring inside the server

- ▶ Using runsv commands to restart, stop or start services or agents.

- ▶ First change to /vo/dirac/startup directory
- ▶ Restarting Services or Agents with runsvctrl

```
$ runsvctrl t /vo/dirac/startup/WorkloadManagement_SiteDirector
```

- ▶ Stoping a service/agent

```
$ runsvctrl d /vo/dirac/startup/WorkloadManagement_SiteDirector
```

- ▶ Starting a service/agent

```
$ runsvctrl u /vo/dirac/startup/WorkloadManagement_SiteDirector
```

Monitoring inside the server

- ▶ Using runsvstat command to check the services/agents status

```
$ runsvstat *
```

```

```

Monitoring inside the server

- ▶ Looking into server log files as dirac user:

```
tail -f /vo/dirac/startup/<System>_<Service or  
Agent>/log/current
```

- ▶ Using the Web Portal follow the links:

System -> Error Console

Monitoring inside the server

- ▶ Sometimes it is useful to check the databases inside MySQL, the user by default is Dirac.

```
$ mysql -u Dirac -p  
Enter password:  
Welcome to the MySQL monitor. Commands end with ; or \g.  
Your MySQL connection id is 45  
Server version: 5.1.53 Source distribution  
  
Copyright (c) 2000, 2010, Oracle and/or its affiliates. All rights reserved.

and you are welcome to modify and redistribute it under the GPL v2 license  
  
Type 'help;' or '\h' for help. Type '\c' to clear the current input statement.  
  
mysql> show databases;  
+-----+  
| Database      |  
+-----+  
| information_schema |  
| AccountingDB    |  
| JobDB          |  
| test            |  
+-----+
```

How to update

- ▶ There are several ways to update a DIRAC sever:
- ▶ Using DIRAC admin CLI - recommended
 - > `update vXrXpx`
- ▶ Running `dirac-install` command with all the attributes
 - \$ `dirac-install -t server -g 2011-06-06 -r vXrXpx`
- ▶ Changing the values in the configuration file:

- ▶ Change the version in DIRAC configuration install file

`Version = vXrXpx`

Execute again:

`install_site.sh install_server.cfg`

What we have learnt?

- ▶ Install a DIRAC Server
- ▶ Use admin CLI to add Instances/Databases/Services/Agents
- ▶ Different ways to check server status
- ▶ Update a server
