## Underwater matable electro-optical connectors: the feedback from Antares

*jeudi 24 avril 2008 12:00 (20 minutes)*

ABSTRACT: In the Antares detector the link between the Junction Box and each of the line anchors is made by a cable (2 electrical conductors + 4 monomode optical fibers) equipped at both ends by a pair of underwater matable connector. The connection is performed by a ROV. I will summarize the experience gained in Antares with this key equipment.
