

Recent advances in neutrinoless double beta decay with energy density functional methods

mercredi 10 octobre 2012 14:25 (40 minutes)

In this presentation I will summarize some recent calculations of the nuclear matrix elements (NME) for neutrinoless double beta decay performed within the energy density functional framework. In particular, I will focussed on the role of pairing, deformation and shell effects in the NME values.

Auteur principal: Dr RODRÍGUEZ, Tomás (Technische Universität Darmstadt)

Orateur: Dr RODRÍGUEZ, Tomás (Technische Universität Darmstadt)

Classification de Session: Double-beta decay and other rare processes

Classification de thématique: Beta-beta decays and other rare processes
