Motivations to search for

$$B_{(s)}^0 \rightarrow \mu^+ \mu^-$$

$B_{(s)}^0 \rightarrow \mu^+ \mu^-$ phenomenology

Model independent expression of the Branching Ratio:

$$B(B_s^0 \rightarrow \mu^+ \mu^-) \propto 1 - \frac{4m_\mu^2}{m_{B_s}^2} |C_S - C'_S|^2 + \left| (C_P - C'_P) + 2 \frac{m_\mu}{m_{B_s}} (C_{10} - C'_{10}) \right|^2$$

In MSSM: $C_{S,P}^{MSSM} \propto \frac{m_b^2 m_\mu^2 \tan^6 \beta}{M_A^4}$

Experimental Picture

Experimental Observable

- Neutral B_s^0 mesons are **mixed**:

$$\langle \Gamma(B_s^0(t) \rightarrow f) \rangle \equiv R_H^f e^{-\Gamma_H^s t} + R_L^f e^{-\Gamma_L^s t}$$

- Experimental observable is the **time integrated B** :

$$B(B_s^0 \rightarrow f)_{\text{exp}} \equiv \frac{1}{2} \int_0^\infty \langle \Gamma(B_s^0(t) \rightarrow f) \rangle dt$$

- Theoretical definition for the prediction:

$$B(B_s^0 \rightarrow f)_{\text{theo}} \equiv \frac{\tau_{B_s^0}}{2} \langle \Gamma(B_s^0(t) \rightarrow f) \rangle \Big|_{t=0}$$

- Time integrated prediction:

$$B(B_s^0 \rightarrow \mu^+ \mu^-)_{\text{exp}}^{\text{SM}} = (3.54 \pm 0.30) \times 10^{-9}$$

Historical Picture

- The story begins in 1984 at CLEO:

PHYSICAL REVIEW D

VOLUME 30, NUMBER 11

1 DECEMBER 1984

Two-body decays of B mesons

B. Search for exclusive $\bar{B}^0$ decays into two charged leptons

Our search for the $\pi^+\pi^-$ final state is not sensitive to the mass of the final-state particles, provided that they are light, since the mass enters only in the energy constraint. Therefore, the upper limit of 0.05% applies for any final-state particles with a pion mass or less. When the final-state particles are leptons the limits are improved by using the lepton identification capabilities of the CLEO detector.¹⁴ For the decay $\bar{B}^0 \rightarrow \mu^+\mu^-$, we improve our limit by requiring that both muons penetrate the iron and produce signals in drift chambers. We find no such events. After correcting for detection efficiency (33%), we set an upper limit of 0.02% at 90% confidence for this decay. We im-

- Since then:

CLEO, ARGUS, UA1, Belle, BaBar, D0, CDF, ATLAS, CMS, **LHCb**

Experimental Status

June 2012

- LHCb Results:

$$B(B^0 \rightarrow \mu^+ \mu^-) < 1.0 \times 10^{-9}$$

$$B(B_s^0 \rightarrow \mu^+ \mu^-) < 4.5 \times 10^{-9}$$

- Significant NP enhancements ruled out for $B(B_s^0 \rightarrow \mu^+ \mu^-)$

- Road map now:

- Constrain $B(B^0 \rightarrow \mu^+ \mu^-)$

- Measure $B(B_s^0 \rightarrow \mu^+ \mu^-)$

Two key points to look for $B_{(s)}^0 \rightarrow \mu^+ \mu^-$:

1. Production of B mesons: (x-section and trigger)
2. Separation Signal/Background (detector performance)

➤ Combinatorial background: $b\bar{b} \rightarrow \mu\mu X$

➤ Physical Backgrounds:

e.g. $B \rightarrow K\pi, KK, \pi\pi$ where K, π decay in flight to μ

Searching for $B_{(s)}^0 \rightarrow \mu^+ \mu^-$ at LHCb

- The LHCb detector:
 - Single arm **forward** spectrometer
 - Acceptance: $2 < \eta < 6$

- Key Point 1: Production** of B mesons:
b quarks are produced forward

Exp.	Accept.	X-section	$b\bar{b}$ pairs
CDF	$ \eta < 1$	$6.3 \pm 0.6 \mu b$	$\sim 1 \times 10^9$
ATLAS CMS	$ \eta < 2.2$	$75 \pm 17 \mu b$	$\sim 4 \times 10^{11}$
LHCb	$2 < \eta < 6$	$94 \pm 8 \mu b$	$\sim 9 \times 10^{10}$

arXiv: 1207.4287v2

LHCb Trigger for $B_{(s)}^0 \rightarrow \mu^+ \mu^-$

Sig. candidates triggered by the μ -lines:

- **Single muon**

L0 requires 1 muon with $p_T > 1.76 \text{ GeV}/c^2$

HLT require IP and mass cut

- **Di-muons**

L0 requires di-muons with $\sqrt{p_{T,1} p_{T,2}} > 1.6 \text{ GeV}/c^2$

HLT require IP and mass cut

Overall: 90% of the sig. candidates pass the trigger

Key Point 2: Separation Sig/Bkg

Sig Separated from Combinatorial Bkg thanks to:

- excellent **mass** and **momentum resolution** (magnet, tracking)

$$\frac{\delta p}{p} \sim 0.4 \rightarrow 0.6\% \text{ for } p = 5 \rightarrow 500 \text{ GeV}/c$$

$$\Delta m_{\mu\mu} \sim 25 \text{ MeV}/c^2 \text{ (2 [3-4] times better than CMS [ATLAS])}$$

- excellent **secondary vertex resolution**: (high boost and tracking)

B average flight distance 10 mm

$$\sigma_{IP} = 25 \mu m \text{ at } p_t = 2 \text{ GeV}/c$$

Sig Separated from Physical Bkg thanks to:

- **particle identification** information (RICH – muons chambers)

$$\epsilon(\mu \rightarrow \mu) \sim 98\%$$

$$\epsilon(\pi \rightarrow \mu) \sim 0.6\%$$

$$\epsilon(K \rightarrow \mu) \sim 0.3\%$$

$$\epsilon(p \rightarrow \mu) \sim 0.3\%$$

LHCb Analysis

Overview of the Analysis

Strategy:

1. Loose selection
2. Classify events in a 2D binned plane
 - $m_{\mu\mu}$ x BDT combining topological information

and derive expectations for sig and bkg

- need control channels

$$B \rightarrow hh' \text{ and } B^+ \rightarrow J/\psi K^+$$

3. Extract Limit and BR

Data Set:

$1.0 \text{ fb}^{-1} + 1.1 \text{ fb}^{-1}$ collected in 2011 and 2012 at 7 and 8 TeV

Blind analysis: all choices are made without looking at the signal region

Selection

- Selection should be:
 - **very efficient** for the signal
 - similar for signal and **control channels**
- **Initial Selection** requires:
 - good tracks with a large impact parameter
 - good and displaced secondary vertex pointing to the primary vertex
- **Tighten** initial selection to reduce combinatorial Bkg:
 - cut on a output of a **MVA** combining information about the candidate **topology**

80% background rejection for 92% signal efficiency.

$B \rightarrow hh'$ after
Initial Selection

$B \rightarrow hh'$ after
Tight Selection

Classification - BDT

- Boosted Decision Tree
- Inputs : 9 inputs variables uncorrelated with $m_{\mu\mu}$
- Trained and tested on MC signal and $b\bar{b} \rightarrow \mu\mu X$

B candidate:

- proper time
- impact parameter
- transverse momentum
- B isolation

muons:

- min p_T
- min IP significance
- dist. of closest approach
- muon isolation,
- polarisation angle

Classification - BDT

- Flat for signal by design
- Sig line shape calibrated on data using an unbiased $B \rightarrow hh'$ sample (same topology as sig)
- Combinatorial Bkg derived from data by interpolating from the mass side-bands

Sig Mass PDF - Mean

- Signal Crystal Ball Shape
- Mean taken from $B^0 \rightarrow \pi\pi, K\pi$ and $B_s \rightarrow KK$

m_{B^0}	$(5284.36 \pm 0.26_{\text{stat}} \pm 0.13_{\text{syst}}) \text{ MeV}/c^2$
$m_{B_s^0}$	$(5371.55 \pm 0.41_{\text{stat}} \pm 0.16_{\text{syst}}) \text{ MeV}/c^2$

- The two modes are resolved: $m_{B_s} - m_{B_d} \sim 87 \text{ MeV} \sim 3.5\sigma_{B^0}$

Sig Mass PDF - Resolution

- $m_{\mu\mu}$ resolution depends on the invariant mass central value:

Interpolate the resolution of the resonances:

J/ψ , $\psi(2S)$, $\Upsilon(1S, 2S, 3S)$

- Averaging with the resolution obtained from the $B \rightarrow hh'$ fits:

$$\sigma_{B^0} = (24.63 \pm 0.13_{\text{stat}} \pm 0.36_{\text{syst}}) \text{ MeV}/c^2$$

$$\sigma_{B_s^0} = (25.04 \pm 0.18_{\text{stat}} \pm 0.36_{\text{syst}}) \text{ MeV}/c^2$$

Normalisation

- Number of signal events corresponding to a B :

$$N_{B_{(s)}^0 \rightarrow \mu^+ \mu^-} \propto B(B_{(s)}^0 \rightarrow \mu^+ \mu^-) \times N_{B_s}$$

- N_{B_s} cannot be obtained directly and precisely at hadron collider
- Need to normalise to a channel of known Br:

$$N_{B_s} \propto \frac{N_{B^+ \rightarrow J/\psi K^+}}{B(B^+ \rightarrow J/\psi K^+)} \times \frac{f_s}{f_d} \qquad N_{B_s} \propto \frac{N_{B^0 \rightarrow K\pi}}{B(B^0 \rightarrow K\pi)} \times \frac{f_s}{f_d}$$

- Correcting for efficiencies: $N_{B_{(s)}^0 \rightarrow \mu^+ \mu^-} =$

$$B(B_{(s)}^0 \rightarrow \mu^+ \mu^-) \times \frac{N_{\text{norm}}}{B_{\text{norm}}} \frac{\epsilon_{\text{sig}}^{\text{REC}} \epsilon_{\text{sig}}^{\text{SEL,REC}}}{\epsilon_{\text{norm}}^{\text{REC}} \epsilon_{\text{norm}}^{\text{SEL,REC}}} \frac{\epsilon_{\text{sig}}^{\text{TRIG,SEL}}}{\epsilon_{\text{norm}}^{\text{TRIG,SEL}}} \frac{f_{B_{(s)}^0}}{f_{\text{norm}}} = \frac{B(B_{(s)}^0 \rightarrow \mu^+ \mu^-)}{\alpha_{\text{norm}}}$$

Extracted
from Data

Evaluated from MC,
x-checked with data

Measured on
data

Ratio of prob for a b quark
to hadronise into a $B_{(s)}^0$ or
into the norm. init. state

$$B^+ \rightarrow J/\psi K^+$$

$$B^0 \rightarrow K\pi$$

- Use f_s/f_d measured at LHCb PRD85 (2012) 032008 and LHCb-PAPER-2012-037
- Weighted average of the 2 channels:

$$\alpha_{B_s^0 \rightarrow \mu^+ \mu^-} = (2.80 \pm 0.25) \times 10^{-10}$$

$$\alpha_{B^0 \rightarrow \mu^+ \mu^-} = (7.16 \pm 0.34) \times 10^{-11}$$

SM expectations 2012+2011 in the mass windows:

$$13 + 11 \ B_s^0 \rightarrow \mu^+ \mu^- \quad \text{and} \quad 1.5 + 1.3 \ B^0 \rightarrow \mu^+ \mu^-$$

Combinatorial Background

- 2011 strategy**

Exponential interpolation from the mass side-bands:

$$[4900 - 5000] \cup [5432 - 6000] \text{ MeV}/c^2$$

- 2012 refinement**

Study additional background sources:

$$B^0 \rightarrow \pi \mu \nu \quad \text{and} \quad B^{0,+} \rightarrow \pi^{0,+} \mu \mu$$

➤ Yields for $[4900 - 6000] \text{ MeV}/c^2$, $\text{BDT} > 0.8$:

$B^0 \rightarrow \pi \mu \nu$	4.04 ± 0.28
$B^{0,+} \rightarrow \pi^{0,+} \mu \mu$	1.32 ± 0.39
$B_{(s)}^0 \rightarrow h h'$	1.37 ± 0.11

Combinatorial Background Interpolation

- Fit the mass side-bands with an exponential and **separate PDFs** for $B_{(s)}^0 \rightarrow h h'$, $B^0 \rightarrow \pi \mu \nu$ and $B^{0,+} \rightarrow \pi^{0,+} \mu \mu$
- **PDF determination** of Exclusive Bkg:
 - Derive **mislabeled probability** $\pi, K \rightarrow \mu$ on data in p and p_T bins
 - Apply these probabilities to large **MC samples**
 - Mass and BDT PDF extracted from the weighted MC sample
 - **Normalisation** to $B^+ \rightarrow J/\psi K^+$
- **Other backgrounds** studied; all negligible:
$$B_s^0 \rightarrow K \mu \nu, \quad \Lambda_b \rightarrow p \mu \nu, \quad B_c \rightarrow J\psi(\mu\mu) \mu \nu$$

$B_s^0 \rightarrow \mu^+ \mu^-$ Candidate

13.5.2012 8:24:38
Run 115275 Event 1941832142 bId 1447

B candidate: $m_{\mu\mu} = 5353.4 \text{ MeV}/c^2$ BDT = 0.826

$p_T = 4077.4 \text{ MeV}/c$ $\tau = 2.84 \text{ ps}$

muons: $p_{T\mu^+} = 2329.5 \text{ MeV}/c$ $p_{T\mu^-} = 4179.4 \text{ MeV}/c$

CLs method

- **Idea:** compare observed data with expectations
- Define a **test statistic** for this comparison:

- Calibrate this test statistic with pseudo-experiments

if Br was such then **Bkg Only** would give $-2\ln Q$ of **such**
Sig + Bkg **such**

- Compute the $-2\ln Q$ of the observed data

$B^0 \rightarrow \mu^+ \mu^-$ upper limits 2011-2012

Compatibility with bkg
only hypothesis:
p-value = $1 - CL_b = 11\%$

Obs. limit: $B(B^0 \rightarrow \mu^+ \mu^-) < 9.4 \times 10^{-10}$ at 95% CL

Exp. limit: $B(B^0 \rightarrow \mu^+ \mu^-) < 7.1 \times 10^{-10}$ at 95% CL

$B_s^0 \rightarrow \mu^+ \mu^-$ sensitivity 2011-2012

Good separation between the 2 expectations

Bkg only p-value:
 5.3×10^{-4}
 3.5σ excess

FIRST EVIDENCE

Double-sided limit at 95% CL :

$$1.1 \times 10^{-9} < B(B_s^0 \rightarrow \mu^+ \mu^-) < 6.4 \times 10^{-9}$$

where the lower and upper limits are evaluated at:

$$CL_{s+b} = 0.975 \text{ and } CL_{s+b} = 0.025$$

Branching Ratio Fit

- **Unbinned maximum likelihood fit** of the $m_{\mu\mu}$ distribution in the 2012 and 2011 BDT bins.
- $B(B_s^0 \rightarrow \mu^+ \mu^-)$ and $B(B^0 \rightarrow \mu^+ \mu^-)$ are free and fit **simultaneously**
- Combinatorial bkg is free
- All other parameters (e.g. m_{B_s} , σ_{B_s} , exclusive bkg...) are gaussian constrained to their expectations
- An **additional systematics** is added to account for the hypotheses made on the combinatorial bkg shape (exponential vs double-exponential)

Fit projections

2011

7 TeV data, 1.0 fb^{-1}

8 BDT bins

$$B_s^0 \rightarrow \mu^+ \mu^-$$

$$B^0 \rightarrow \mu^+ \mu^-$$

$$B_s^0 \rightarrow h^+ h'^-$$

$$B^0 \rightarrow \pi^- \mu^+ \nu_\mu$$

$$B^{\pm,0} \rightarrow \pi^{\pm,0} \mu^+ \mu^-$$

total

2012

8 TeV data, 1.1 fb^{-1}

7 BDT bins

In the Signal Region $BDT > 0.5$

In the Signal Region $BDT > 0.7$

Fit Results 2011+2012

Profile Likelihood:
All parameters except $B(B_s^0 \rightarrow \mu^+ \mu^-)$ are floated within their errors.

$$B(B_s^0 \rightarrow \mu^+ \mu^-) = (3.2^{+1.5}_{-1.2}) \times 10^{-9}$$

Value in agreement with SM prediction:

$$B(B_s^0 \rightarrow \mu^+ \mu^-)_{SM} = (3.54 \pm 0.30) \times 10^{-9}$$

Nota: 95% interval in perfect agreement with the one provided by the CL_s method

Conclusions

- $B_{(s)}^0 \rightarrow \mu^+ \mu^-$ are very powerful tests of the SM

Harvest of the LHCb analysis of the data collected in 2012 and 2011:

- Constrains on $B^0 \rightarrow \mu^+ \mu^-$:

$$B(B^0 \rightarrow \mu^+ \mu^-) < 9.4 \times 10^{-10}$$

- First evidence of $B_s^0 \rightarrow \mu^+ \mu^-$:

$$\text{p-value: } 5.3 \times 10^{-4}$$

$$3.5\sigma$$

- BR measurement:

$$B(B_s^0 \rightarrow \mu^+ \mu^-) = 3.2_{-1.2}^{+1.5} \times 10^{-9}$$

Paper submitted at PRL, arXiv: 1211.2674

Impact of the results

- Hard time for SuperSymmetry...

- But SUSY never dies ;-)

The observation is "*quite consistent with supersymmetry*". In fact, it was actually expected in (some) supersymmetric models. *I certainly won't lose any sleep over the result.*

J. Ellis interviewed by BBC

Spares

Fit Statistical Error

Fix all the nuisance parameters to their expectations, subtract the error in quadrature with the errors obtained when all parameters are floating:

$$B(B_s^0 \rightarrow \mu^+ \mu^-) = 3.2_{-1.2}^{+1.4}(\text{stat})_{-0.3}^{+0.5}(\text{syst}) \times 10^{-9}$$

fully dominated by stat error

Comparison 2012-2011

- 2011, 7 TeV (1 fb^{-1})

$$B(B_s^0 \rightarrow \mu^+ \mu^-) = 1.4_{-1.3}^{+1.7} \times 10^{-9}$$

p-value 0.11

- 2012, 8 TeV (1.1 fb^{-1}):

$$B(B_s^0 \rightarrow \mu^+ \mu^-) = 5.1_{-1.9}^{+2.4} \times 10^{-9}$$

p-value 9×10^{-4}

results from 7 TeV and 8 TeV are compatible at $\sim 1.5\sigma$

Exclusive Background Effect on 2011
