

Spin physics with AFTER

AFTER @ LHC

Cynthia Hadjidakis

Joint meeting LUA9-AFTER
Orsay, November 18th 2013

- Nucleon spin physics
- Physics opportunities with AFTER
- Polarizing the target

Probing the nucleon structure

Nucleon constituents:
quarks (u, d, s, ...) and
gluons

Deep inelastic scattering experiments: $l p \rightarrow l' X$
scale = Q : virtual photon energy

Drell-Yan experiments: $p p \rightarrow l^+ l^- X$
scale = Q : $l^+ l^-$ invariant mass

and also:

$p p \rightarrow \text{jet}$

$p p \rightarrow W, Z$

$p p \rightarrow \text{Isolated photons}$

...

Momentum distribution function f_1 measurements
 $\rightarrow q(x, Q^2)$: parton distribution functions (pdfs)
probability to find a parton in the nucleon with a
longitudinal momentum fraction x at momentum
transfer Q^2

Deep Inelastic Scattering (DIS)

longitudinal momentum fraction x at momentum
transfer Q^2

The spin puzzle of the nucleon

Nucleon spin = 1/2: how do the partons form the nucleon spin?

$$S_N = \frac{1}{2} = \frac{1}{2} \overbrace{(\Delta u_v + \Delta d_v + \Delta q_s)}^{\approx 30\%} + \overbrace{\Delta G}^{\approx 0\%} + \Delta L_z^q + \Delta L_z^g \quad ?$$

total quark contribution

gluon contribution

angular momentum

Parton distribution functions

8 distributions

- three leading twist pdfs: f_1 , g_1 and h_1
 - depend on (x, Q^2)
- five Transverse Momentum Distributions (TMDs)
 - depend on (x, Q^2, k_T) with k_T the parton transverse momentum \rightarrow 3-D picture of the nucleon
 - vanish when integrating over k_T
 - describe the correlations between the parton or the nucleon spin with the parton transverse momentum: spin-orbit correlations

Luminosities in pp @ 115 GeV

- **Intensity:** $N_{\text{beam}} = 5 \cdot 10^8 \text{ protons.s}^{-1}$
 - **Beam:** 2808 bunches of $1.15 \cdot 10^{11} \text{ p} = 3.2 \cdot 10^{14} \text{ p}$
 - **Bunch:** Each bunch passes IP at the rate: $\sim 11 \text{ kHz}$
 - **Instantaneous extraction:** IP sees $2808 \times 11000 \sim 3 \cdot 10^7$ bunches passing every second \rightarrow extract ~ 16 protons in each bunch at each pass
 - **Integrated extraction:** Over a 10h run: extract $\sim 5.6\%$ of the protons stored in the beam

- **Instantaneous Luminosity**

$$L = N_{\text{beam}} \times N_{\text{Target}} = N_{\text{beam}} \times (\rho \times e \times N_A)/A$$
 - $N_{\text{beam}} = 5 \times 10^8 \text{ p}^+/\text{s}$
 - e (target thickness) = 1 cm
- **Integrated luminosity**
 - 9 months running/year
 - 1 year $\sim 10^7 \text{ s}$

Target (1 cm thick)	ρ (g cm $^{-3}$)	A	\mathcal{L} ($\mu\text{b}^{-1} \text{s}^{-1}$)	$\int \mathcal{L}$ ($\text{pb}^{-1} \text{yr}^{-1}$)
solid H	0.088	1	26	260
liquid H	0.068	1	20	200
liquid D	0.16	2	24	240
Be	1.85	9	62	620
Cu	8.96	64	42	420
W	19.1	185	31	310
Pb	11.35	207	16	160

\Rightarrow Large luminosity in pH and pD $\sim 0.2 \text{ /fb/yr}$ for a 1 cm thick target

\Rightarrow Larger luminosity with 50 cm or 1 m H2 or D2 target (1 m \leftrightarrow 20 /fb/yr = LHC in 2012)

Quarkonium yields in pp @ 115 GeV

Inclusive pp cross-sections

⇒ AFTER provides a competitive luminosity to study target spin related measurements

⇒ Complementary x_p range with other spin physics experiments

Target experimental setup: COMPASS example

- ◆ Specifications
 - ◆ Superconducting solenoid : 2.5 T
 - ◆ 16 trim coils
 - ◆ Field homogeneity: 10^{-4}
 - ◆ Dipole magnet (long. or transverse): 0.5 T
 - ◆ Temperature: ~ 50 mK (frozen)
 - ◆ Materials: NH_3 , ^6LiD
 - ◆ Dilution factor: ~ 0.4
- ◆ Performances
 - ◆ Polarization: $>90\%$, $>50\%$
 - ◆ Field reversal: 8h, 24h

Space constraints for the polarized targets

Target experimental setup: COMPASS example

NH₃ material

⁶LiD material

time relaxation ~ 1000 hours

Conclusion

- LHC proton continuous extraction with bent crystal on a fixed (polarized or not) target offers many spin physics opportunities
- High boost and large luminosities provide access to large and very large parton x measurements for quarks and gluons: QCD laboratory at large x
- Space and time constraints for the polarized targets

Rapidity boost in a fixed target mode

- **Very high boost:**
 - With 7 TeV beam
 $\gamma = \sqrt{s}/(2m_p) = 61.1$ and $y_{\text{CMS}} = 4.8$
 - With 2.76 TeV beam
 $\gamma = 38.3$ and $y_{\text{CMS}} = 4.3$
- $y_{\text{lab}} = y_{\text{CM}} + y_{\text{CMS}}$
 - forward region:** $y_{\text{CM}} > 0$
 - backward region:** $y_{\text{CM}} < 0$
- $\eta = -\ln \tan \theta/2$ (= y for massless particles)
 - With 7 TeV beam
 $y_{\text{CM}} = 0 \leftrightarrow \theta \sim 16 \text{ mrad} (0.9^\circ)$

For a $2 \rightarrow 1$ process (e.g. $gg \rightarrow QQ\bar{q}$)

$$x_{1,2} = M/\sqrt{s} e^{\pm y_{\text{CM}}}$$

y_{CM} : $QQ\bar{q}$ CMS rapidity

M : $QQ\bar{q}$ mass

- $y_{\text{lab}} = 4.8 \leftrightarrow y_{\text{CM}} = 0 \rightarrow x_1 = x_2$
- **backward region:** $y_{\text{CM}} < 0 \rightarrow x_1 < x_2$
- $y_{\text{lab}}(J/\Psi) \sim 1.2 \rightarrow x_2 = 1$
- $y_{\text{lab}}(Y) \sim 2.4 \rightarrow x_2 = 1$

Good condition to access large target x_2 and low $x_F = x_1 - x_2 \rightarrow -1$: target-rapidity region
