The New Muon $g-2$ Experiment at Fermilab

jeudi 20 mars 2014 18:46 (5 minutes)

The measurement of the anomalous magnetic moment of the muon provides a test of the standard model and a handle on physics beyond the standard model. There is currently a three sigma discrepancy between theory and experiment. With 20 times the statistics and a factor of four improvement in the systematic errors, a new experiment at Fermilab aims to resolve this difference. I will present the current status of the experiment and show results from recent beam tests of the calorimeter and the tracker.
