Rencontres de Moriond EW
La Thuile, March 21st, 2014

Neutrino oscillations

- $P_{\bar{\nu}_\alpha \rightarrow \bar{\nu}_\beta} \neq 0$ only if $\Delta m_{kj}^2 = m_k^2 - m_j^2$ and $U_\nu \neq \mathbb{1}$
- **Best fit** (nu-fit.org)

solar	$\theta_{12} \simeq 34^\circ$	$\Delta m_{12}^2 \simeq 7.5 \times 10^{-5} \text{eV}^2$
atmospheric	$\theta_{23} \simeq 42^\circ$	$ \Delta m_{23}^2 \simeq 2.4 \times 10^{-3} \text{eV}^2$
reactor	$\theta_{13} \simeq 8.8^\circ$	
- Different mixing pattern, ν lightness $\stackrel{?}{\leftarrow}$ Majorana nature
- SM: no ν mass term, lepton flavour is conserved
 \Rightarrow **need new Physics**
 - Radiative models
 - Extra dimensions
 - R-parity violation in supersymmetry
 - **Seesaw mechanism** \rightarrow BAU through leptogenesis ?
- Neutrino oscillations = Neutral lepton flavour violation
 Why not **charged lepton flavour violation (cLFV)** ?

cLFV

- In the Standard Model: cLFV from higher order processes
⇒ negligible
- If cLFV observed:
 - Clear evidence of physics at a higher scale
 - Probe the origin of lepton mixing
 - Probe the origin of New Physics
- Complementary to other New Physics searches
 - High energy: LHC
 - High intensity:
 - B factories: Rare decays, etc
 - Neutrino dedicated experiments: U_{PMNS} non-unitarity...
 - Other low energy experiments: $(g - 2)_\mu$, EDM, LUV...

cLFV

- First search in 1947: $\text{Br}(\mu \rightarrow e\gamma) < 10\%$ [Hincks and Pontecorvo, 1948]
- Radiative decays, e.g. $\text{Br}(\mu \rightarrow e\gamma) < 5.7 \times 10^{-13}$ [MEG, 2013]
- 3-body lepton decays,
e.g. $\tau \rightarrow 3\mu < 2.1 \times 10^{-8}$ [Belle, 2010]
- Neutrinoless muon conversion,
e.g. $\mu^-, \text{Au} \rightarrow e^-, \text{Au} < 7 \times 10^{-13}$ [SINDRUM II, 2006]
- Meson decays, e.g. $B_d^0 \rightarrow e\mu < 2.8 \times 10^{-9}$ [LHCb, 2013]

Higgs boson discovery

- Discovery of a Higgs boson at LHC in 2012, with properties compatible with the SM Higgs [ATLAS, 2012; CMS, 2012]
- Evidence for $H \rightarrow \tau^+ \tau^-$ (CMS: 3.2σ , ATLAS: 4.1σ)
Active searches of $H \rightarrow \mu^- \mu^+$ and $H \rightarrow e^+ e^-$
- Timely to consider LFV Higgs decays, e.g. $H \rightarrow \bar{\tau} \mu$
- LHC sensitivity to $\text{Br}(H \rightarrow \bar{\tau} \mu) = 4.5 \times 10^{-3}$ with 20fb^{-1}
[Davidson and Verrier, 2012]

The inverse seesaw mechanism

- Inverse seesaw \Rightarrow Consider fermionic gauge singlets ν_{Ri} ($L = +1$) and X_i ($L = -1$) [Mohapatra and Valle, 1986]

$$\mathcal{L}_{inverse} = -Y_{\nu}^{ij} \overline{L}_i \tilde{H} \nu_{Rj} - M_R^{ij} \overline{\nu}_{Ri} X_j - \frac{1}{2} \mu_X^{ij} \overline{X}_i^C X_j + \text{h.c.}$$

$$\text{with } m_D = Y_{\nu} \nu, M^{\nu} = \begin{pmatrix} 0 & m_D & 0 \\ m_D^T & 0 & M_R \\ 0 & M_R^T & \mu_X \end{pmatrix}$$

$$m_{\nu} \approx \frac{m_D^2 \mu_X}{m_D^2 + M_R^2}$$

$$m_{N_1, N_2} \approx \mp \sqrt{m_D^2 + M_R^2} + \frac{M_R^2 \mu_X}{2(m_D^2 + M_R^2)}$$

2 scales: μ_X and M_R

Effective approach to seesaw mechanisms

- Seesaw mechanism: New fields with a mass $M_R > \text{EW scale}$ and Majorana mass terms
 \Rightarrow Generate m_ν in a **renormalizable** theory and at tree-level
- Notice that lepton number conservation is **accidental** in the SM
- **Unique** dimension 5 operator for all seesaw mechanisms
 \rightarrow Violates lepton number L \Rightarrow **Majorana neutrinos**

$$\delta\mathcal{L}^{d=5} = \frac{1}{2} c_{ij} \frac{(H \cdot L_i)^\dagger (H \cdot L_j)}{\Lambda} + \text{h.c.}$$

- To distinguish the several seesaw mechanisms, either
 - Directly produce the heavy states (LHC, ILC)
 - Look for dimension ≥ 6 operators effects \rightarrow **cLFV**, precision test measurements, etc

Inverse seesaw experimental tests

- Inverse seesaw: $Y_\nu \sim \mathcal{O}(1)$ and $M_R \sim 1$ TeV
⇒ testable at the LHC and low energy experiments
- LHC/ILC signatures
 - single lepton + dijet + missing energy [Das and Okada, 2012]
 - di-lepton + missing p_T [Bhupal Dev et al., 2012, Bandyopadhyay et al., 2013]
 - tri-lepton + missing E_T [Das and Okada, 2012, Mondal et al., 2012]
 - invisible Higgs decays [Banerjee et al., 2013]
- Low energy:
 - deviations from lepton universality [Abada, Teixeira, Vicente and CW, 2014]
 - charged lepton flavour violation [Bernabéu et al., 1987, Deppisch et al., 2006]
 - neutrinoless double beta decay
[Awasthi et al., 2013, Abada and Lucente, 2014]

Diagrams

- In the Feynman-'t Hooft gauge, same as [Arganda et al., 2005]:

(1)

(2)

(3)

(4)

(5)

(6)

(7)

(8)

(9)

(10)

- Formulas adapted from [Arganda et al., 2005]

- Diagrams 1, 8, 10 → **dominate** at large M_R

- Enhancement** from:
 - $-\mathcal{O}(1) Y_\nu$ couplings
 - TeV scale n_i

Constraints

- Neutrino data → Use of a modified **Casas-Ibarra parametrization** [Casas and Ibarra, 2001]
- Charged lepton flavour violation
→ **Most constraining**: $\text{Br}(\mu \rightarrow e\gamma) < 5.7 \times 10^{-13}$ [MEG, 2013]
- Lepton universality violation: less constraining than $\mu \rightarrow e\gamma$
- Electric dipole moment: **0** with **real** PMNS and mass matrices
- Invisible Higgs decays: $M_R > m_H$, **does not apply**

Constraints: focus on $\mu \rightarrow e\gamma$

- M_R and μ_X real and degenerate

- Constrains μ_X

- Perturbativity $\rightarrow \left| \frac{Y_\nu^2}{4\pi} \right| < 1.5$

- light ν mass: $m_\nu \simeq \frac{Y_\nu Y_\nu^T}{M_R^2} \mu_X$

dim 6 operator: $\frac{Y_\nu Y_\nu^\dagger}{M_R^2} \simeq \frac{m_\nu}{\mu_X}$

Dependence on ISS parameters

- M_R and μ_X degenerate and real
- Perturbativity $\rightarrow \left| \frac{y_\nu^2}{4\pi} \right| < 1.5$
- Dips come from **interferences** between diagrams

Searching for maximal $\text{Br}(H \rightarrow \bar{\tau}\mu)$

- M_R and μ_X degenerate and real
- Excluded by $\mu \rightarrow e\gamma$
Non-perturbative Y_ν
- $\text{Br}(H \rightarrow \bar{\tau}\mu) < \sim 10^{-10}$

Full scan: $H \rightarrow \bar{\tau}\mu$ 

- M_R and μ_X real and random
- No gain in a complex scenario

- Excluded by constraints
- Agree with all constraints

- $\text{Br}(H \rightarrow \bar{\tau}\mu) \leq 10^{-9} - 10^{-10}$

Full scan: $H \rightarrow \bar{\tau}e$ and $H \rightarrow e\bar{\mu}$

- μ_X real and random
 M_R diagonal and degenerate
- Excluded by constraints
Agree with all constraints
- $\text{Br}(H \rightarrow \bar{\tau}e) \leq 10^{-9} - 10^{-10}$
 $\text{Br}(H \rightarrow \bar{\mu}e) \leq 10^{-13} - 10^{-14}$
- No gain in a complex scenario

Conclusions

- cLFV \Rightarrow **Clear evidence** of new physics
- LFV Higgs decays: **complementary** to other cLFV searches
- **Enhancement** from the inverse seesaw
but largest values excluded by $\mu \rightarrow e\gamma$
- $\text{Br}(H \rightarrow \bar{\tau}\mu) \leq 10^{-9} - 10^{-10}$
 $\text{Br}(H \rightarrow \bar{\tau}e) \leq 10^{-9} - 10^{-10}$
 $\text{Br}(H \rightarrow \bar{\mu}e) \leq 10^{-13} - 10^{-14}$
- In the inverse seesaw, LFV Higgs decays allowed by radiative LFV bounds seem not to be reachable at LHC
