

# Discussion around GW and GRBs

- Is the time window used to search for GW emission seems reasonable ?
  - [-5s 1s] for searching coalescing binaries (only on shorts GRBs)
  - [-600s max(60s, T90)] for others type of analyses/GRBs
- Can we work together on subthreshold triggers from space missions (possible subluminal GRBs) ?
- When a detection of a GRB is done both in EM and GW, what physics can be done (studies between central engine and jets, ...) ?
- How to combine information from GW and EM - can we use more information from EM to help search for GW ?
