COMPASS-II

JLab's 12 GeV upgrade Spin observables on an EIC Phenomenology Toolkit

Conclusions

DVCS described by 4 Compton Form Factors. Approximations : guark sector, leading twist and leading order.

• GPD
$$F = H, E(-)$$
 or $H, E(+)$.
 $\mathcal{F} = \int_{-1}^{+1} dx F(x,\xi,t) \left(\frac{1}{\xi - x - i\epsilon} \mp \frac{1}{\xi + x - i\epsilon}\right)$

• Integration yields real and imaginary parts to ${\mathcal F}$:

Compton Form Factor at Leading Order

$$Re\mathcal{F} = \mathcal{P} \int_{-1}^{+1} dx F(x,\xi,t) \left(\frac{1}{\xi-x} \mp \frac{1}{\xi+x}\right)$$
$$Im\mathcal{F} = \pi \left(F(\xi,\xi,t) \mp F(-\xi,\xi,t)\right)$$

• Existence of dispersion relations at fixed t.

Extraction methods Universality Key results

Future orientations

COMPASS-II

JLab's 12 GeV upgrade Spin observables on an EIC Phenomenology Toolkit

Conclusions

Overview of current extraction methods. Problems : Model dependence ? Degrees of freedom ? Extrapolations ?

Local fits

Take each kinematic bin independantly of the others. Extraction of $Re\mathcal{H}$, $Im\mathcal{H}$, ... as independent parameters.

Global fit

Take all kinematic bins at the same time. Use a parametrization of GPDs or CFFs.

Hybrid : Local / global fit

Combine two previous methods to estimate model dependence.

Neural networks

Already used ofr PDF fits. In progress for GPDs.

GPDs and DVCS Leading twist, leading order Selected data

Status of GPD analysis

Extraction methods Universality Key results

Future orientations

COMPASS-II JLab's 12 GeV upgrade Spin observables on an EIC Phenomenology Toolkit

Conclusions

- **Dominance** of twist 2 and **validity** of a GPD analysis of DVCS data.
- ImH best determined. Large uncertainties on ReH.
- However sizeable **higher twist contamination** for DVCS measurements.
- Already some indications about the invalidity of the *H*-dominance hypothesis.
- Today cross-sections seem a bigger constraint to phenomenology than BSAs.
- Question : What observable should be measured ? Accuracy ?

COMPASS-II.

Future orientations

COMPASS-II

JLab's 12 GeV upgrade

Spin observables on an EIC Phenomenology

Phenomenology Toolkit

Conclusions

JLab's 12 GeV upgrade. Dealing with 1 % statistical accuracy.

- $\chi^2/dof \simeq 7.63$ goes to 6.91 assuming more realistic 5 % uncertainty (statistical + systematic).
- Despite high χ^2 , **fair agreement** with previous extractions of *H* at 6 GeV.
- Need careful analysis to see the (low) quality of the fit !
- Current hypothesis (*H*-dominance, ...) **no longer useable**.
- What observable should be measured ? High precision asymmetries seem a big constraint !

2011 situation

GPDs and DVCS Leading twist, leading order Selected data

Status of GPD analysis

Extraction methods Universality Key results

Future

compass-II

JLab's 12 GeV upgrade

Spin observables on an EIC

Phenomenology Toolkit

Conclusions

Local fits.

Is the accuracy sufficient for model-independent fitting ?

• Structure of BSA at twist 2 (Guichon-Vanderhaeghen formalism) :

$$BSA = \frac{a \sin \phi + b \sin 2\phi}{1 + c \cos \phi + d \cos 2\phi + e \cos 3\phi}$$

where

$$egin{aligned} &a = \mathcal{O}(Q^{-1}) & d = \mathcal{O}(Q^{-2}) \ b = \mathcal{O}(Q^{-4}) & e = \mathcal{O}(Q^{-5}) \ c = \mathcal{O}(Q^{-1}) \end{aligned}$$

- Underconstrained problem (8 fit parameters : real and imaginary parts of 4 CFFs *H*, *E*, *H* and *E*).
- Need other asymmetries on same kinematic bin (or add ~ 5-10 % systematic uncertainty).

Electron Ion Collider.
